INITIAL SITE ASSESSMENT

Geary Corridor Bus Rapid Transit Project San Francisco, California

EXECUTIVE SUMMARY

BASELINE Environmental Consulting ("BASELINE") conducted this Initial Site Assessment ("ISA") for the Geary Corridor Bus Rapid Transit Project ("Project") study area (Figure 1). The Project proposes to implement a bus rapid transit system along Geary Boulevard/Street, between 48th Avenue and the south of Market Street area. The purpose of this ISA was to rank the level of risk associated with hazardous materials, hazardous waste, and/or contamination at the Project study area that could potentially affect proposed construction activities and/or operations.

This ISA has identified a medium risk of soil and groundwater contamination from reported hazardous materials releases, aerially-deposited lead, and naturally-occurring asbestos. This ISA has identified a low hazard risk associated with contaminants in historic fill materials, lead-based paint and asbestos-containing materials on structures, and yellow traffic stripes and pavement markings.

BASELINE recommends performing a limited Preliminary Site Investigation (PSI) to characterize the quality of soils (and groundwater if any excavation were to extend into the groundwater) only in the areas of concern identified in this ISA that would be disturbed by Project construction. This would include a limited investigation of soils disturbed for foundations and from excavation of existing medians and the installation and relocation of communication and power utilities. Analytical results should be screened against applicable regulatory thresholds to evaluate appropriate actions to determine appropriate disposal and/or reuse options. Significant dewatering of groundwater from excavations would not be anticipated based on project details, but, if necessary, groundwater should be stored in tank(s) during construction activities and the water quality should be characterized prior to disposal or recycling. A construction risk management plan should be implemented by contractors with procedures for identifying and mitigating previously unknown contamination that may be encountered during construction. This report should be provided to the Project contractors, so the findings may be incorporated into their Health and Safety and Hazards Communication Programs.

INITIAL SITE ASSESSMENT

Geary Corridor Bus Rapid Transit Project San Francisco, California

1. INTRODUCTION

This report presents the activities and findings of an Initial Site Assessment ("ISA") performed by BASELINE Environmental Consulting ("BASELINE") for the proposed Geary Corridor Bus Rapid Transit Project ("Project") study area, located along Geary Boulevard/Street in San Francisco, California (Figure 1).

1.1. Purpose of the Initial Site Assessment

BASELINE performed this ISA at the request of Jacobs Engineering Group ("JACOBS") in support of the design and environmental review of the Project. The purpose of this assessment was to rank the level of risk associated with hazardous materials, hazardous waste, and/or contamination at the Project study area that could potentially affect proposed construction activities and/or operations in accordance with Chapter 10 of the California Department of Transportation ("Caltrans") Environmental Handbook (Caltrans, 2013). In accordance with Caltrans guidance, potential sources of contamination in the study area were identified as Recognized Environmental Conditions ("RECs") as defined in the American Society of Testing and Materials ("ASTM") Method E1527-05, Standard Practice for Environmental Site Assessments: Phase I Environmental Assessment Process.

1.2. Scope of Services

The scope of services for this ISA included: review of physical setting sources, historical land use information, and regulatory agency online files and databases; site reconnaissance of current land use conditions; and preparation of this report to document our findings, conclusions, and recommendations. A completed ISA checklist for the Project is included as Appendix A.

2. PROJECT DESCRIPTION

The proposed project involves implementing bus rapid transit (BRT) service along the Geary corridor in San Francisco, between 48th Avenue and Market Street. Project features and alternatives are described below.

2.1. Project Features

The project would involve the following features (common to all build alternatives):

2.1.1. Consolidated Bus Service

The build alternatives propose converting an existing mixed-traffic lane to a bus-only lane and would operate bus service in this lane in both the eastbound and westbound directions. The build alternatives would replace existing 38-Limited bus stops with BRT stations within the project limits (the "Geary corridor"), and implement other transit enhancements, such as increased bus service; deployment of specialized, branded bus vehicles; and distinctive branded BRT stations. For all build alternatives, permanent facilities and improvements would occur within the existing public right-of-way and no permanent acquisition of private property is anticipated.

2.1.2. Transit Improvements

Bus-only lanes: All build alternatives would result in the conversion of one mixed traffic lane in each direction to a bus-only lane in each direction between 34th Avenue and Market Street. The bus-only lane would be distinguished from mixed-traffic lanes by a physical barrier and/or colored pavement.

- **Bus service and enhanced operations**: The build alternatives would include BRT service instead of the current 38-Limited service. The new BRT service would have reduced headways (i.e., the time interval between the arrival of successive buses on the same line), and increased service span (i.e., longer hours of service).
- Transit Signal Priority (TSB): All build alternatives would include the installation of fiber-based TSP on all signalized intersections between 25th Avenue and Masonic Avenue.
 This type of TSP technology differs from the wireless TSP that would be installed under the No Build scenario.
- BRT-branded vehicles with level boarding: BRT service would be provided by vehicles similar to the new low-floor buses that are currently proposed for the Geary corridor. However, the vehicles would feature BRT "branding" markings to differentiate this different type of bus service.
- **Distinctive BRT stations**: All build alternatives would include high-quality stations with amenities to distinguish the BRT bus service.
- Bus bulbs: The BRT stations would feature bulb-outs. These pavement features are a
 physical extension of the sidewalk toward the travel lane that serve as a bus stop. Bus
 bulbs can improve transit performance by eliminating the need for buses to exit and
 reenter the flow of traffic at each stop.

2.1.3. Roadway and Multimodal Changes

Mixed-flow traffic and parallel parking: Mixed-flow traffic would be reduced from three
lanes to two lanes in each direction in the majority of the corridor. A lane of parallel onstreet parking would generally be provided adjacent to the north and south sides of the
Geary corridor. Diagonal parking between 25th Avenue and Park Presidio Boulevard
would be replaced with parallel parking, providing enough space to create a bus-only
lane in each direction.

- Pavement rehabilitation and resurfacing: Construction of the bus-only lanes would involve new colorization by grinding away the existing top layer of the street pavement and filling it with color in the pavement resurfacing mix, along with additional striping. Given municipal regulations that work on city streets must be done in five-year time blocks (i.e., once a street has been modified, it cannot be changed for the subsequent five years), the changes under the proposed project would be planned in coordination with other agencies that have planned projects in the corridor within the project's time frame. This would likely result in curb-to-curb rehabilitation and resurfacing within the Geary corridor, west of Van Ness Avenue.
- Bicycle path between Masonic Avenue and Presidio Avenue: In coordination with SFMTA's Masonic Street Design traffic-calming project, the proposed project would include a Class II bicycle path to be striped on Geary Boulevard between Masonic Avenue and Presidio Boulevard. The pathway on this block would be painted green and be set aside exclusively for bicycles.
- Landscaping improvements: The proposed project would include raised, landscaped medians from 48th Avenue to Gough Street. The alternatives, described briefly in the next section, vary in whether the existing median would remain or if it would be replaced by new medians.
- **Driveway and sidewalk modifications on O'Farrell Street near Van Ness Avenue**: A split stop is proposed on O'Farrell Street, where there would be two separate stops for the BRT bus service and the 38-Local bus service.

2.2. Project Alternatives

The following alternatives are currently being analyzed in the Environmental Impact Report/Environmental Impact Statement (EIR/EIS) for the project:

- Alternative 1: No Build Alternative
- Alternative 2: Side-Lane BRT
- Alternative 3: Center-Lane BRT with Right-Side Boarding and Dual Medians
- Alternative3B: Center-Lane BRT with Right-Side Boarding, Dual Medians and Consolidated Bus Service

Certain project improvements, described above, would occur even if the project were not built, and are therefore included in the No Build Alternative. These include high quality buses with low floors, pavement rehabilitation, curb ramp upgrades, traffic signal infrastructure, real-time traffic management, TSP, pedestrian countdown signals, and accessible pedestrian signals.

The build alternatives propose similar improvements within the Geary corridor, but vary in design. The most significant variation is that in Alternative 2, the BRT lanes and platforms would be constructed on the outside edge of Geary Boulevard/Street, while in Alternatives 3 and 3B the BRT lanes and platform would be constructed in the roadway median. Under Alternatives 3 and 3B, the Fillmore Street underpass would be filled and part of an adjoining pump station would be demolished. Under Alternatives 2 and 3, the 38-Limited transit line

would be replaced by the BRT system, leaving the 38-Local service to operate as it does today, while Alternative 3B would consolidate both the 38-Limited and 38-Local lines into the BRT system.

3. HYDROGEOLOGIC SETTING

The Project study area extends approximately 6.5 miles across San Francisco, and has a range of hydrogeologic conditions. The western end of the study area has an elevation of approximately 200 feet above mean sea level ("msl") (USGS, 1973) and is located approximately one-quarter mile east of the Pacific Ocean (Figure 1). The eastern end of the study area has an elevation of approximately 15 feet above msl (USGS, 1973) and is located approximately one-quarter mile southwest of San Francisco Bay (Figure 1). The topography in the Project study area north of Market Street is hilly, with a high elevation of 270 feet above msl near Masonic Avenue, and a low elevation of 25 feet above msl at Market Street. The topography south of Market Street is relatively flat with an elevation ranging from 15-25 feet above msl.

The eastern half of the Project study area is in the Downtown groundwater basin, and based on topography, surface and groundwater would be expected to flow to the east, toward San Francisco Bay. The western half of the Project study area is in the Lobos and Westside groundwater basins, and surface and groundwater in that part of the Study area would be expected to flow to the west, toward the Pacific Ocean. Depth to groundwater likely varies with the topography. Depth to groundwater at 3675 Geary Boulevard, near the center of the Project study area, is approximately 19 to 46 feet below ground surface "bgs") (Conestoga-Rovers & Associates, 2013). Depth to groundwater at the Transbay Terminal, near the eastern end of the Project study area, is approximately 12 feet bgs (Shaw Environmental, 2008).

4. METHODOLOGY

4.1. Hazardous Material Site Identifications

Data sources related to historical land uses, current land uses, and environmental records from regulatory agencies were reviewed to identify known or potential sites associated with hazardous materials within one-eighth mile of the Project study area. These sites were then evaluated to identify known or potential releases of hazardous materials that could impact soils and/or groundwater beneath the Project construction areas.

Following the review of data sources and evaluation of hazardous materials release sites, the level of risk related to each site that could impact the Project, as well as other environmental concerns, was assessed and RECs were identified in accordance with the ASTM standard and Caltrans guidelines.

4.2. Other Environmental Concerns

Based on Caltrans guidelines and previous experience working on large transportation projects, other environmental concerns that could pose a risk to Project development were identified

and evaluated. These environmental concerns include aerially-deposited lead ("ADL"), historical fill materials, naturally-occurring asbestos, and lead and asbestos in structural materials.

5. CURRENT LAND USES

Current land uses at and adjacent to the Project site were determined by a site reconnaissance performed on 6 August 2013. The site reconnaissance was conducted to identify evidence of past or current use, storage, disposal, or releases of hazardous materials within the Project study area. Evidence of hazardous materials releases could include apparent odors, stained or discolored surfaces, and stressed or damaged vegetation. All observations were made from public rights-of-way.

No obvious evidence of hazardous materials releases was noted during the reconnaissance, but a total of 45 sites associated with possible hazardous materials use were identified during the reconnaissance. Photographs of these sites are included in Appendix B. These sites are identified in Table 1 and Figures 2A-2C and are described below in further detail.

- **Corrosive material storage area.** One currently-vacant storage area (Site 20 in Table 1) had a hazardous materials placard indicating the storage of corrosive materials.
- **Dry cleaners.** Seventeen clothing dry cleaner shops were identified in the study area (Table 1). These businesses often use and dispose of industrial solvents, primarily tetrachloroethylene, used for dry cleaning clothes.
- **Gasoline stations.** Seven gasoline stations were identified in the study area (Table 1). These sites typically store thousands of gallons of petroleum products in underground storage tanks (USTs).
- Transportation facilities. Two transit stations were identified in the study area (Sites 1 and 19 in Table 1). These sites may potentially include vehicle fueling and maintenance areas which could use, store, and dispose of fuels, lubricants, and other hazardous materials.
- **Vehicle repair shops.** Eighteen vehicle repair shops were identified in the study area (Table 1). These facilities typically use, store, and dispose of fuels, lubricants, solvents, and paints.

6. HISTORICAL LAND USES

Historical land uses in the Project study area were reviewed to assess potential sources of hazardous materials that could have affected soils and/or groundwater beneath the study area. In addition, the general uses of properties adjacent to the study area were identified to assess potential sources of contamination that could migrate beneath the study area.

Historical land uses in the Project vicinity were determined by reviewing historical aerial photographs from 1931, 1938, 1946, 1956, 1968, 1974, 1982, 1993, and 1998, which are included as Appendix C. Due to the size of the Project study area, only broad patterns of development were reviewed.

In 1931 and 1938, the dates of the first available aerial photographs, the entire Project study area was already densely developed. The western part of the Project study area was largely residential, with larger buildings between Divisidero and Market Streets, suggesting commercial uses. Land uses south of Market Street appeared largely industrial.

These land use patterns exhibited in the 1931 and 1938 aerial photographs were largely consistent with aerial photographs dated after 1938. Between 1956 and 1982, increasing commercial development was noted in the central part of the Project study area, between Presidio Boulevard and Van Ness Avenue, replacing smaller residential buildings.

The most significant land use changes occurred in the portion of the Project study area South of Market. During the 1950s, highway structures for the Embarcadero Freeway and San Francisco-Oakland Bay Bridge were constructed in this area. After 1974, industrial uses south of Market Street gradually changed to commercial and office uses. By 1993, the earthquake damaged Embarcadero Freeway had been removed north of Folsom Street, and additional office buildings were constructed in this area following the 1989 Loma Prieta earthquake.

7. REGULATORY AGENCY RECORDS

BASELINE contracted with Environmental Data Resources, Inc. ("EDR"), an environmental resource service, to conduct a preliminary search of federal, state, tribal, and local regulatory agency records pertaining to past and present hazardous materials use, storage, generation, disposal, and releases on properties at or near the Project study area. On 27 February 2013, an environmental records search was conducted by EDR using search distances that were equal to or greater than the minimum search distances presented in ASTM E1527-05 ranging up to one mile from the study area.

7.1. Methodology

The EDR database report identified more than 5,000 sites within one-eighth mile of the Project study area on lists and databases related to the use, storage, handling, disposal, or release of hazardous materials. The complete findings of the environmental records search and descriptions of the sources reviewed are documented in the EDR DataMap Environmental Atlas (EDR, 2013) included in Appendix D.

The entire database report was reviewed, and those lists indicating either significant hazardous material storage or disposal as well those sites with known or suspected hazardous materials releases were further evaluated to determine whether contamination from those sites would have the potential to affect the Project. These sites included:

Y8363-00 01288 ISA-8/29/2013

7.1.1. Hazardous Materials Storage and Disposal

- **Aboveground and Underground Storage Tanks.** These sites, registered with the San Francisco Department of Public Health ("SFDPH") Local Oversight Program ("LOP"), store hundreds or thousands of gallons of petroleum products.
- Registered hazardous waste generators and handlers. These sites are registered under the federal Resource Conservation and Recovery Act ("RCRA") to generate or handle hazardous wastes. Only those sites with significant, on-going hazardous waste generation (generating more than 100 kilograms ["kg"] of hazardous waste or more than one kg of acutely hazardous waste per month) are required to register under RCRA.

7.1.2. Hazardous Material Release Sites

- Federal Hazardous Materials Sites. These sites are overseen by US Environmental Protection Agency ("US EPA") and include National Priority List ("NPL") sites, commonly referred to as Superfund sites, and Comprehensive Environmental Response, Compensation, and Liability Information System ("CERCLIS") sites, which include sites evaluated by the for potential inclusion on the NPL.
- State Hazardous Materials Sites. These sites are listed on the State Department of Toxic Substances Control ("DTSC") ENVIROSTOR database. ENVIROSTOR includes sites from a variety of State hazardous materials cleanup programs, as well as hazardous waste treatment facilities.
- Leaking Underground Tank Sites. These sites participate in the San Francisco Bay Regional Water Quality Control Board ("Regional Water Board") leaking underground petroleum tank program, overseen locally by SFDPH LOP.
- Spills, Leaks, Investigations, and Cleanup ("SLIC") Sites. These sites participate in the Regional Water Board SLIC program, which investigates and remediates groundwater contamination sites that are not associated with petroleum tanks.
- **Hazardous Materials Incident Sites.** These sites have reported a one-time release of hazardous materials, generally due to an accident or equipment failure.

These sites are shown in Tables 2 through 5, Figures 3 through 6, and are further described below. Site numbers in the text refer to Site identification numbers in the tables and figures.

7.2. Hazardous Materials Storage and Disposal

7.2.1. Underground and Aboveground Storage Tanks

The environmental database search identified 470 registered underground storage tank ("UST") sites and 12 registered aboveground storage tank ("AST") sites within one-eighth mile of the Project study area (Table 2 and Figures 3A-3C). Most USTs greater than 55 gallons in volume

require registration. AST sites do not need to be registered unless the AST sites have an aggregate storage of greater than 1,320 gallons. Many of these sites are listed as inactive, indicating that the storage tanks have been removed or were closed in-place.

7.2.2. Hazardous Waste Generators and Handlers

The environmental database search identified 147 RCRA-registered hazardous waste facilities within one-eighth mile of the Project study area (Table 3 and Figures 4A-C). 118 of these were small-quantity generators, registered to generate between 100 and 1,000 kg per month of non-acutely hazardous waste. Eighteen sites were large-quantity generators, registered to generate greater than 1,000 kg/month of hazardous waste, or more than one kg/month of acutely hazardous waste. Eleven sites were registered hazardous materials handlers or transporters, businesses that do not generate hazardous waste but may transport or temporarily store such wastes.

7.3. Federal Hazardous Materials Sites

No sites within one-eighth mile of the Project study area were listed on the US EPA NPL list, although one site was listed in the CERCLIS database (Table 4). CERCLIS is a federal program to investigate and remediate high-priority hazardous material sites, excluding those where only petroleum contamination is discovered. Depending on the preliminary findings of the investigations and potential health risks of the site, the sites may be elevated to the NPL list.

The CERCLIS site identified within the Project study area was Arabian American Oil Company, at 22 Battery Street (site CERCLIS-1 in Table 4 and Figure 5C). The site was screened under a DTSC program in 2000, but no further action was required. As no releases from this site have been identified, it would not be expected to affect soil or groundwater within the Project study area.

7.4. State Hazardous Materials Sites

Two sites were identified on the State ENVIROSTOR database within one mile of the Project study area (Table 4). Online files regarding the active hazardous material cleanup sites were reviewed to determine the potential for releases to affect soil or groundwater within the Project study area (DTSC, 2013). Details regarding that review are provided below.

The California Oak Cleaners site (DTSC-1 in Table 4 and Figure 6A) was evaluated by DTSC due to the detection of trace concentrations of solvents in shallow soil samples. The site is closed, with no further action proposed by DTSC.

At the 199 Fremont Street site (DTSC-2 in Table 4 and Figure 5C), soils proposed to be disturbed for a redevelopment project were found to be contaminated with lead and solvents. In 1998, DTSC performed technical review on a health risk assessment and a site mitigation plan for the site. Contaminants in fill materials are a concern at many sites south of Market Street; this topic is discussed further below under Section 8.2.

Based on available information, the reported contaminant releases at the State hazardous materials sites would not be likely to affect soils or groundwater at the Project study area, though contaminants from historical fill material may be a concern in portions of the study area south of Market Street.

7.5. Leaking Underground Storage Tanks

The environmental database report identified 188 sites within one-eighth mile of the Project study area with releases from leaking underground petroleum storage tanks (Table 5 and Figure 6A-C). All but two of those sites have been closed, indicating that remediation was completed or was not necessary. Online files for the two active sites were reviewed using the Geotracker database (Regional Water Board, 2013).

A release of gasoline was reported at the Chevron Station 9-0535 site at 3675 Geary Boulevard (LUST-3 in Table 5 and Figure 6B). The release was discovered in January 1987 when all existing USTs and product piping were removed and replaced. Groundwater monitoring has been performed since that time. During three months from November 2009 to January 2010, groundwater batch extraction was used to remediate the site. Approximately 4,900 gallons of groundwater were extracted from the wells, which appear to have reduced the concentrations of Total Petroleum Hydrocarbons (TPH) as gasoline and benzene in groundwater (Conestoga-Rovers & Associates, 2010). Monitoring is ongoing to evaluate the effectiveness of the remedial action. The most recent groundwater monitoring event, from March 2013, identified concentrations of TPH as gasoline at up to 41 mg/L and benzene at up to 13 mg/L, which were significantly elevated over the concentrations reported immediately after the remedial action (Conestoga-Rover & Associates, 2013). This suggests that additional remedial action may be required at this site. Groundwater from this site is flowing toward the northwest, toward the adjacent intersection of Geary Boulevard and Arguello Boulevard and contaminants from this site may have migrated with the groundwater and affected subsurface conditions at the Project study area.

A release of diesel was reported at the World Communications, Inc. site at 450 Mission Street (Site LUST-173 in Table 5 and Figure 6D) in January 2013. A 2,000-gallon UST was removed from the site at this time, and although it was located in a concrete and brick vault, oily groundwater was discovered during the removal. After the oily water was removed, additional oily groundwater re-entered the vault. The oily water contained 11 mg/L of TPH as diesel and 13 mg/L of TPH as motor oil (SFDPH, 2013). The source of the contamination is not yet known. In April 2013, SFDPH LOP submitted a letter requesting an environmental investigation be performed at the site. No groundwater flow direction has been determined, so it is not known if contaminated groundwater at this site may have migrated and affected subsurface conditions in the Project study area.

7.6. Spills, Leaks, Investigations, and Cleanup ("SLIC") Sites

The environmental database review identified four sites within one-eighth mile of the Project study area in the SLIC program (Table 4). The SLIC program includes sites with known or

Y8363-00 01288 ISA-8/29/2013

suspected groundwater contamination that is not associated with a leaking underground storage tank.

The four SLIC sites include one that has been closed, and two that have been listed as inactive for more than ten years (Table 4). Online files for the remaining active site were reviewed using the Geotracker database (Regional Water Board, 2013).

Tetrachloroethylene (PCE) and related compounds have been identified in groundwater beneath the Kaiser Project site, located at 2130 O'Farrell Street (Table 4 and Figure 5B). This is believed to be a result of dry-cleaning operations conducted at the site from 1929 until 1951 (AMEC, 2008). The release was discovered in 1987, and interim groundwater extraction and treatment began in 1988. When a new parking structure was constructed at this location in 1991, a new groundwater extraction and monitoring system was installed.

Between 1991 and 2008, over 56 million gallons of groundwater have been extracted from the site, and approximately 70 pounds of PCE were removed (AMEC, 2008). Groundwater continues to be extracted from the site at a rate of 0.2 gallons per minute (Haley & Aldrich, 2013). The most recent groundwater monitoring event, in February 2013, identified PCE in groundwater at the site at concentrations of up to 0.56 mg/L, above the California Maximum Contaminant Level ("MCL") of 0.005 mg/L (Haley & Aldrich, 2013). MCLs are drinking water standards, which are used as the cleanup goals at this site, as the groundwater is a potential drinking water source.

Groundwater at this site generally flows toward the east (Haley & Aldrich, 2013), making it hydraulically cross-gradient from the Project study area. However, as this site is located adjacent to Geary Boulevard, there may be a potential for contaminants to have migrated from this site and affected subsurface conditions at the Project study area.

7.7. Hazardous Materials Incidents

A total of 48 sites at or near the alignment appear on the California Hazardous Materials Incident Reporting System (CHMIRS) and/or the federal Emergency Response Notification System (ERNS) (Table 4 and Figures 5A-5C). Each of these sites involved a hazardous material spill reported to emergency response teams as a result of an accident or equipment failure. As noted in Table 4, most of these incidents involve small quantities of hazardous materials that were noticed and cleaned up immediately after reporting. As none of the releases resulted in follow-up investigation or regulatory oversight, according to information from the environmental database report, it is unlikely that the spills at these sites would significantly affect soil or groundwater in the Project study area.

8. OTHER ENVIRONMENTAL CONCERNS

The following discussions are about sources of potential hazardous materials that could pose an environmental risk to the Project, but are considered outside the standard scope of ASTM E1527 05 (i.e., do not necessarily meet the definition of a REC).

8.1. Aerially-Deposited Lead

Lead alkyl compounds were first added to gasoline in the 1920s. Beginning in 1973, the United States Environmental Protection Agency ordered a gradual phase out of lead from gasoline that significantly reduced the prevalence of leaded gasoline by the mid-1980s. Prior to the 1970s, the EPA estimated that vehicles emitted approximately 75 percent of the lead consumed in leaded gasoline as particulate matter in the exhaust (DTSC, 2004). As a result, shallow soils within approximately 30 feet of the edge of pavement in roadway corridors have the potential to be contaminated with ADL from historical car emissions prior to the elimination of lead in gasoline (DTSC, 2009).

Based on a review of historical aerial photographs, Geary Boulevard has been a major roadway since at least 1931, long before the phase-out of lead in gasoline. Therefore, exposed shallow soils at the Project study area within approximately 30 feet of the edge of current or historical paved areas could be contaminated with ADL.

8.2. Historical Fill Material/Maher Ordinance

Much of the area near the eastern San Francisco waterfront was filled during the late 1800s and early 1900s with material of unknown origin. Some of this fill material has been found to contain elevated concentrations of contaminants such as metals and polynuclear aromatic hydrocarbons. The eastern portion of the Project study area (south of Market Street, on Main, Beale, Fremont, and Folsom streets) falls within the jurisdiction of Article 22A of the San Francisco Health Code, which is administered by SFDPH (also referred to as the Maher Ordinance). The Maher Ordinance applies to all projects that result in the excavation of more than 50 cubic yards of soil located bayward of historic high tide lines (i.e., on land that has been filled) for which a building permit is required.

The Project does not propose any excavation in the Article 22A area, but if this were to change, the Maher Ordinance would require the preparation of a site history report for the project site, soil sampling and analysis, a soil analysis report, a site mitigation report (if needed), and certification that the measures recommended in the site mitigation report were implemented.

8.3. Lead-Based Paint and Asbestos in Structures

Structures in the Project study area that may be affected by the Project, such as bus shelters and the Fillmore Street pump station, may be coated with lead-based paint and/or asbestos-containing materials. Although the use of lead paint and asbestos-containing materials in the United States began to be phased out in the 1970s and 1980s, they continue to be used for specialized uses, such lead chromate used in traffic paints and asbestos fibers used to strengthen specialized concrete components. Lead and asbestos are state-recognized carcinogens, and lead is a reproductive toxicant (California Environmental Protection Agency, 2012). Demolition or renovation of structures containing lead-based paint and/or asbestos-containing materials could pose a risk of releasing lead particles and asbestos fibers into the environment.

8.4. Naturally-Occurring Asbestos

Geologic mapping from the United States Geological Survey ("USGS") shows that serpentinite bedrock underlies a portion of the Project study area between Masonic Avenue to the west and Brockerick Street to the East (USGS, 2013). Serpentinite is a metamorphic rock that often contains naturally-occurring asbestos. Therefore, excavation in this area that disturbs this material could encounter asbestos, creating a potential public health hazard during development of the Project and requiring special soil management and disposal procedures.

8.5. Yellow Traffic Striping and Pavement Markings

Lead and hexavalent chromium have been used in yellow thermoplastic and yellow paint for traffic striping and pavement marking for many years and as recently as 2004 (Caltrans, 2006). The residue that may be produced from the yellow thermoplastic and yellow paint during road improvement activities may contain lead and hexavalent chromium concentrations that could produce toxic fumes when heated. The debris produced during the removal of yellow thermoplastic and yellow paint may need to be disposed of as a California and/or federal hazardous waste if the concentrations of lead or hexavalent chromium exceed hazardous waste thresholds.

9. DATA GAPS

The ASTM E1527-05 requires the identification of data gaps, along with actions taken to address these gaps, and an opinion as to whether these gaps are significant. A data gap may result from a lack of or inability to obtain information during any of the activities required by ASTM E1527 05, including, but not limited to the review of historical land use information and regulatory agency records, site reconnaissance, or interviews. In particular, review of reasonably ascertainable historical land use information from the first developed land use to the present that does not provide sufficient detail to assess potential land use changes at five year intervals may be considered a data gap.

Several data gaps were identified during the review of historical land use records due to the time intervals between records exceeding ten years (Appendix C). The data gaps are not considered significant because land uses were reasonably consistent between each data gap. No other data gaps were identified during this ISA.

10. ASTM E1527-05 DEVIATIONS

The purpose of this ISA was not to qualify for landowner liability protections associated with commercial real estate transactions under the Comprehensive Environmental Response, Compensation, and Liability Act ("CERCLA"). As a result, the following deviations from ASTM E1527-05, which are intended to meet or exceed the federal requirements for landowner liability protections under CERCLA, do not have a significant effect on the findings or conclusions of this ISA:

- The Project study area is not a single contiguous commercial parcel, as assumed in ASTM E1527-05, and therefore a title search to identify potential environmental liens and activity and use limitations associated with commercial parcels was not conducted.
- Interviews with past, present, and prospective owners or operators who are likely to have material information regarding the potential for contamination at the Project study area were not conducted, because such were not reasonably available due to the large number of parcels in the Study area.
- Interviews with state or local regulatory officials regarding the potential for contamination in the Project study area and vicinity were not conducted, because any information obtained would likely duplicate information already reviewed from federal, state, and local regulatory agency records.

11. FINDINGS

In accordance with ASTM E1527-05, the review of available data resources and evaluation of hazardous materials release sites has identified known or potential sources of hazardous materials releases that could impact soils and/or groundwater beneath the Project study area that would qualify as a REC:

Reported Hazardous Materials Releases

Three reported releases of hazardous materials, at 3675 Geary Boulevard, 450 Mission Street, and 2130 O'Farrell Street, have affected groundwater at/or near the Project study area.

This ISA has also identified the following environmental concerns associated with hazardous materials, hazardous waste, and/or contamination at the Project study area that are considered outside the standard scope of ASTM E1527-05, but which have the potential to affect the proposed Project:

Aerially-Deposited Lead

Exposed shallow soils in the Project study area within approximately 30 feet of the edge of paved areas could be contaminated with ADL from historical vehicle emissions.

Historical Fill Materials

Should excavation be proposed in the portion of the Project study area south of Market Street, contaminants from fill materials may be encountered. The Project would also be required to comply with investigation and mitigation requirements of the Maher Ordinance.

Lead-Based Paint and Asbestos-Containing Materials

Bus shelters, a pump station, and other structures may be coated with lead-based paint and/or asbestos-containing materials that, if Project development were to disturb them,

could pose a risk to human health and the environment during Project demolition and renovation activities.

Naturally-occurring asbestos

Bedrock underlying a portion of the Project study area consists of serpentinite, which may contain naturally-occurring asbestos. Disturbance of this material could result in a public health hazard and/or require special management and disposal procedures.

• Yellow Traffic Stripe and Pavement Markers

Existing yellow thermoplastic and yellow paint striping and markings on roadways at the Project study area may contain elevated concentrations of lead and hexavalent chromium, which could result in human exposures during restriping activities.

12. CONCLUSIONS

12.1. Recognized Environmental Conditions

We have performed this ISA in conformance with the scope and limitations of ASTM E1527-05 for the Project study area. Any exceptions to, or deletions from, this practice are described in Section 10 of this report. This assessment has revealed three RECs in connection with the Project study area: reported hazardous materials releases at 3675 Geary Boulevard, 450 Mission Street, and 2130 O'Farrell Street.

12.2. Other Environmental Conditions

This assessment has also identified environmental concerns at the Project study area that are considered outside the standard scope of ASTM E1527 05. In accordance with the Caltrans Environmental Handbook, this assessment has identified the following risk levels associated with known or suspected hazardous materials, hazardous waste, and/or contamination at the Project study area that could potentially affect proposed construction activities and/or operations:

- ADL in exposed shallow soils adjacent to roadways from historical vehicle emissions
- Contaminants from historical fill material in the western portion of the Project study area
- Lead-based paint and asbestos-containing materials on existing buildings and structures
- Naturally-occurring asbestos from serpentinite bedrock
- Lead and hexavalent chromium in existing yellow traffic stripe and pavement marking

12.3. Risk Analysis

Based on guidance in the Caltrans Environmental Handbook, this assessment has identified the following risk levels associated with hazardous materials, hazardous waste, and/or

contamination within the Project study area. These risks could affect the cost, scope, and/or schedule of proposed Project construction activities and/or operations.

- Reported hazardous materials releases Medium Risk
- Aerially-deposited lead in soil Medium Risk
- Contaminants in historic fill materials Low Risk
- Naturally-occurring asbestos from bedrock Medium Risk
- Lead-based paint and asbestos-containing materials on structures Low Risk
- Lead and hexavalent chromium in yellow thermoplastic and yellow paint striping and markings on roadways – Low Risk

13. RECOMMENDATIONS

13.1. Preliminary Site Investigation

Prior to construction, a limited Preliminary Site Investigation should be performed to investigate hazardous materials concerns related to soil, groundwater, and construction materials in the Project study area, as identified in this ISA. Only those areas where soils will be disturbed during construction, such as for sign foundations and excavation for communication and power utilities, should be sampled.

Soil samples should be tested for contaminants specific to the hazardous materials concerns identified in that location. For example, aerially-deposited lead is a potential concern throughout the Project study area, while naturally-occurring asbestos is potentially present in only a small portion of the study area. Accordingly, samples in all areas should be analyzed for total and soluble lead, while only samples from excavation areas overlying serpentinite bedrock should be analyzed for asbestos.

Additional investigation may be required to fully evaluate potential hazardous materials issues if concerns are identified during the Preliminary Site Investigation. All environmental investigations at the Project should be provided to project contractors, so the findings may be incorporated into their Health and Safety and Hazard Communication Programs.

Soil Investigation. The general areas and contaminants of concern for investigating soils are summarized below.

Soil samples should be collected in the areas of concern summarized below in areas where Project construction activities will disturb the soils. Soil analytical results should be screened against the Regional Water Board's Environmental Screening Levels ("ESLs") and other applicable risk-based standards to determine appropriate actions to ensure the protection of

construction workers, future site users, and the environment and also be screened against state and federal hazardous waste thresholds to determine soil management options.

Aerially-Deposited Lead

Representative samples of exposed shallow soils should be collected within 30 feet of the edge of the roadway and analyzed for total lead and soluble lead.

Naturally-occurring Asbestos

Representative samples of soils should be collected from Project construction areas in areas where serpentinite bedrock is present.

Groundwater Investigation. Groundwater should be collected in areas near reported hazardous materials release sites and analyzed for TPH and volatile organic compounds if project excavations were to extend into the groundwater in those area. Hazardous materials releases sites that have affected groundwater near the Project study area are located at 3675 Geary Boulevard, 450 Mission Street, and 2130 O'Farrell Street.

Additional hazardous materials releases may occur or be discovered in the future. In accordance with ASTM E1527-05 guidance, the findings of this ISA are only presumed to be valid for 180 days after completion. Therefore, an updated review of regulatory agency records should be conducted prior to the groundwater investigation, to ensure that groundwater that will be encountered during construction is properly investigated.

Hazardous Building Materials Survey. Traffic paints and structures that will be modified or demolished should be sampled and analyzed as part of a Hazardous Building Materials Survey.

13.2. Hazardous Materials Management and Disposal

Based on the findings and recommendations of the Preliminary Site Investigation, the Project may need to implement special soil, groundwater, and construction materials management and disposal procedures for hazardous materials, as well as construction worker health and safety measures during construction. In addition to the findings and recommendations of the Preliminary Site Investigation, the following measures should be implemented during the Project.

- Groundwater from dewatering of excavations, if any, should be stored in Baker tank(s)
 during construction activities and the water should be characterized prior to disposal or
 recycling.
- A construction risk management plan should be implemented by contractors with procedures for identifying and mitigating potentially unreported releases of hazardous materials.

15. LIMITATIONS

This ISA was performed to provide an understanding of the current environmental conditions at the Project study area. BASELINE's interpretations and conclusions regarding this information and presented in this report are based on the expertise and experience of BASELINE in conducting similar assessments and current local, state, and federal regulations and standards.

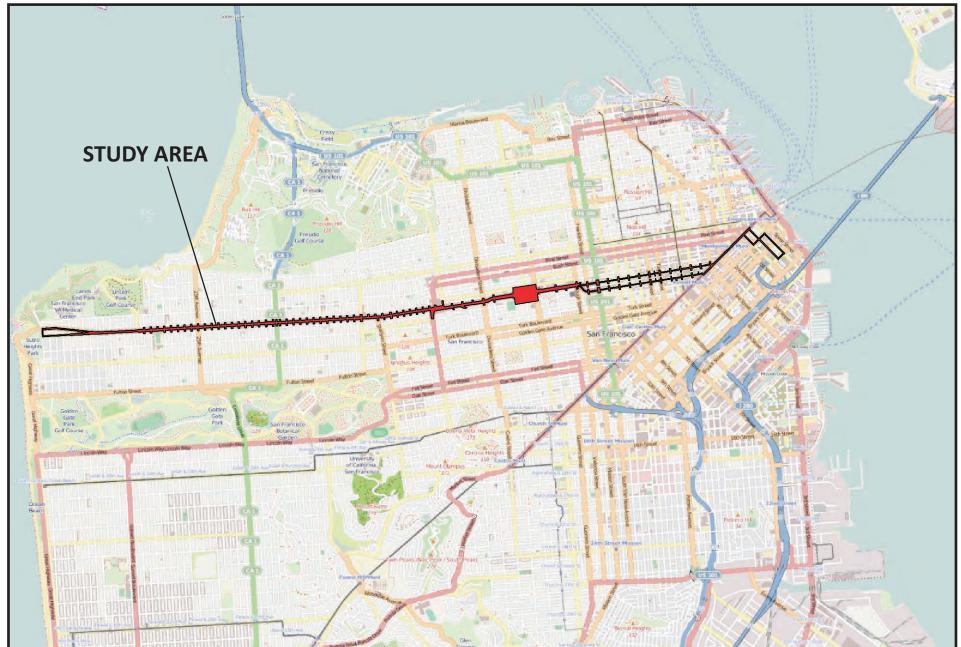

BASELINE's objective is to perform our work with care, exercising the customary thoroughness and competence of earth science, environmental, and engineering consulting professionals, in accordance with the standard for professional services for a consulting firm at the time these services were provided. It is important to recognize that even the most comprehensive scope of services may fail to detect environmental conditions and potential liability at a particular site. Therefore, BASELINE cannot act as insurers and cannot "certify or underwrite" that a site is free of environmental contamination, and no expressed or implied representation or warranty is included or intended in this report except that the work was performed within the limits prescribed with the customary thoroughness and competence of our profession.

The passage of time, manifestation of latent conditions, or occurrence of future events may require further exploration at the Site, analysis of the data, and re-evaluation of the findings, observations, conclusions, and recommendations expressed in this report.

The findings, observations, conclusions, and recommendations expressed by BASELINE in this report are limited by the scope of services and should not be considered an opinion concerning the compliance of any past or current owner or operator of the Site with any federal, state, or local law or regulation. No warranty or guarantee, whether expressed or implied, is made with respect to the data reported or findings, observations, conclusions, and recommendations expressed in this report.

APPENDICES

(PDF ON CD-ROM)

A: ISA CHECKLIST

B: PHOTOGRAPHS FROM SITE RECONNAISSANCE

C: HISTORICAL AERIAL PHOTOGRAPHS

D: ENVIRONMENTAL DATABASE REPORT

E: QUALIFICATIONS OF PREPARERS

Initial Site Assessment (ISA) Checklist

Project Information

County San Francisco, Route Geary Blvd/Street

Description: The Project will install a bus rapid transit system in the Geary Corridor.

Project Manager <u>Irene Avetyan, JACOBS</u> phone # (510) 457-0027

Project Engineer Cris Subrizi, MSA Design phone # (415) 609-2067

Project Screening

Attach the project location map to this checklist to show location of all known and/or potential HW sites identified. See Figures 3-6 of the ISA report

1. Project Features: New R/W? No Excavation? Yes Railroad Involvement? No

Structure demolition/modification? No Subsurface utility relocation? No

2. Project Setting: **Urban roadway**

Rural or Urban: Urban

Current land uses: **Urban roadway**

Adjacent land uses: Residential and commercial

- 3. Check federal, State, and local environmental and health regulatory agency records as necessary, to see if any known hazardous waste site is in or near the project area. If a known site is identified, show its location on the attached map and attach additional sheets, as needed, to provide pertinent information for the proposed project. See Tables 2-5, Figures 3-6, and the discussion in section 7 of the ISA report.
- 4. Conduct Field Inspection. Date: <u>7 March 2013</u>; <u>See discussion in section 5</u>, <u>Table 1</u>, <u>and Appendix B of the ISA report.</u>

STORAGE STRUCTURES / PIPELINES:

Underground tanks **None** Surface tanks **None**

Sumps None Ponds None

Drums None Basins None

Transformers None Landfill None

Other N/A

Initial Site Assessment (ISA) Checklist

CONTAMINATION: (spills, leaks, illegal dumping, etc.)

Surface staining **None** Oil sheen **None**

Odors None Vegetation damage None

Other None

HAZARDOUS MATERIALS: (asbestos, lead, etc.)

Buildings None Spray-on fireproofing None

Pipe wrap None Friable tile None

Acoustical plaster None

Serpentine <u>Yes – see section 8.4 of ISA for details</u>

Paint **Traffic striping**

Other None

- 5. Additional record search, as necessary, of subsequent land uses that could have resulted in a hazardous waste site. Potential contamination may be present on the Project site from three reported release sites, aerially-deposited lead, and naturally-occurring asbestos. See findings reported in section 11 of the ISA report.
- 6. Other comments and/or observations: Refer to Executive Summary of the ISA report.

ISA Determination

Does the project have potential hazardous waste involvement? <u>Yes</u> If there is known or potential hazardous waste involvement, is additional ISA work needed before task orders can be prepared for the Investigation? **No.** If "YES," explain; then give an estimate of additional time required:

A brief memo should be prepared to transmit the ISA conclusions to the Project Manager and Project Engineer.

Executive Summary of the ISA report provided to the Project Manager and Project Engineer.

The EDR Aerial Photo Decade Package

EDR Aerial Photo Decade Package

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

When delivered electronically by EDR, the aerial photo images included with this report are for ONE TIME USE ONLY. Further reproduction of these aerial photo images is prohibited without permission from EDR. For more information contact your EDR Account Executive.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified.

The Map ID column refers to the Map ID-Focus Map(s) of the listed site.

Sites listed in bold italics are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

FEDERAL RECORDS

CERCLIS: The Comprehensive Environmental Response, Compensation and Liability Information System contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

A review of the CERCLIS list, as provided by EDR, and dated 02/04/2013 has revealed that there is 1

CERCLIS site within the searched area.

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 02/12/2013 has revealed that there are 23 RCRA-LQG sites within the searched area.

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 02/12/2013 has revealed that there are 136 RCRA-SQG sites within the searched area.

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 02/12/2013 has revealed that there are 11 RCRA NonGen / NLR sites within the searched area.

HIST FTTS: A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

A review of the HIST FTTS list, as provided by EDR, and dated 10/19/2006 has revealed that there are 29 HIST FTTS sites within the searched area.

US AIRS: The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

A review of the US AIRS list, as provided by EDR, and dated 01/23/2013 has revealed that there is 1 US AIRS site within the searched area.

HAZNET: The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000-1,000,000 annually, representing approximately 350,000-500,000 shipments. Data from non-California manifests & continuation sheets are not included at the present time. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, & disposal method. The source is the Department of Toxic Substance Control is the agency

A review of the HAZNET list, as provided by EDR, and dated 12/31/2011 has revealed that there are 1894 HAZNET sites within the searched area.

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 05/06/2013 has revealed that there are 5 ENVIROSTOR sites within the searched area.

RECOLOGY, INC.	50 CALIFORNIA ST FL 24	1-1

HWT: A listing of hazardous waste transporters. In California, unless specifically exempted, it is unlawful for any person to transport hazardous wastes unless the person holds a valid registration issued by DTSC. A hazardous waste transporter registration is valid for one year and is assigned a unique registration number.

A review of the HWT list, as provided by EDR, and dated 04/15/2013 has revealed that there is 1 HWT site within the searched area.

EDR PROPRIETARY RECORDS

EDR MGP: The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

A review of the EDR MGP list, as provided by EDR, has revealed that there is 1 EDR MGP site within the searched area.

PG AND E GAS PLANT SAN FRANCIS	FIRST, HOWARD, FREMONT,	75-10

EDR US Hist Auto Stat: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR US Hist Auto Stat list, as provided by EDR, has revealed that there are 799 EDR US Hist Auto Stat sites within the searched area.

EDR US Hist Cleaners: EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR US Hist Cleaners list, as provided by EDR, has revealed that there are 1283 EDR US Hist Cleaners sites within the searched area.

Subject: FMS POAQC Project TIP ID SF-070004 (Geary Bus Rapid Transit) update: Project is a not a

POAQC

To: chester.fung@sfcta.org, eileen.ross@sfmta.com

Cc: fms@mtc.ca.gov, hbrazil@mtc.ca.gov

Dear Project Sponsor

Based on the recent interagency consultation with the Air Quality Conformity Task force, Project TIP ID SF-070004 (FMS ID:2292.00) does not fit the definition of a project of air quality concern as defined by 40 CFR 93.123(b)(1) or 40 CFR 93.128 and therefore is not subject to PM2.5 project level conformity requirement. Please save this email as documentation confirming the project has undergone and completed the interagency consultation requirement for PM2.5 project level conformity. Note project sponsors are required to undergo a proactive public involvement process which provides opportunity for public review as outlined by 40 CFR 93.105(e). For projects that are not of air quality concern, a comment period is only required for project level conformity determinations if such a comment period would have been required under NEPA. For more information, please see FHWA PM2.5 Project Level Conformity Frequently Asked Questions (FAQ):

http://www.fhwa.dot.gov/environment/air quality/conformity/reference/fags/pm25fags.cfm

If you have any questions, please direct them to Harold Brazil at hbrazil@mtc.ca.gov or by phone at (510) 817-5747

Air Quality and Greenhouse Gas Report	

4.12 Air Quality and Greenhouse Gases

This Air Quality Impact Report provides an overview of existing air quality conditions and evaluates the construction and operational impacts associated with the proposed project. This analysis focuses on air pollution from two perspectives: daily emissions and pollutant concentrations. Emissions refer to the quantity of pollutants released into the air, measured in pounds per day. Concentrations refer to the amount of pollutant material per volumetric unit of air, measured in parts per million or micrograms per cubic meter. The following defines the pollutants discussed in this analysis.

The federal and State governments have established ambient air quality standards for outdoor concentrations of six common pollutants, called criteria pollutants, to protect public health. The criteria pollutant standards have been set at levels above which concentrations could be harmful to human health and welfare. These standards are designed to protect the most sensitive persons from illness or discomfort. Criteria pollutants include carbon monoxide (CO), ozone (O₃), nitrogen dioxide (NO₂), sulfur dioxide (SO₂), particulate matter 2.5 microns or less in diameter (PM_{2.5}), particulate matter ten microns or less in diameter (PM₁₀), and lead (Pb). These pollutants are discussed below.

CO is a colorless and odorless gas formed by the incomplete combustion of fossil fuels. CO is emitted almost exclusively from motor vehicles, power plants, refineries, industrial boilers, ships, aircraft and trains. In urban areas such as the project location, automobile exhaust accounts for the majority of CO emissions. CO is a non-reactive air pollutant that dissipates relatively quickly, so ambient CO concentrations generally follows the spacial and temporal distributions of vehicular traffic. CO concentrations are influenced by local meteorological conditions, primarily wind speed, topography and atmospheric stability. CO from motor vehicle exhaust can become locally concentrated when surface-based temperature inversions are combined with calm atmospheric conditions, a typical situation at dusk in urban areas between November and February. Inversion is an atmospheric condition in which a layer of warm air traps cooler air near the surface of the earth, preventing the normal rising of surface air. The highest levels of CO typically occur during the colder months of the year when inversion conditions are more frequent. In terms of health, CO competes with oxygen, often replacing it in the blood, thus reducing the blood's ability to transport oxygen to vital organs. The results of excess CO exposure can be dizziness, fatigue, and impairment of central nervous system functions.

O₃ a colorless gas that is formed in the atmosphere when reactive organic gases (ROG), which includes volatile organic compounds (VOC) and NO_X react in the presence of ultraviolet sunlight. O₃ is not a primary pollutant; it is a secondary pollutant formed by complex interactions of two pollutants directly emitted into the atmosphere. The primary sources of ROG and NO_X, components of O₃, are automobile exhaust and industrial sources. Meteorology and terrain play major roles in O₃ formation. Ideal conditions occur during summer and early autumn, on days with low wind speeds or stagnant air, warm temperatures and cloudless skies. The greatest source of smog-producing gases is the automobile. Short-term exposure

(lasting for a few hours) to O₃ at levels typically observed in Southern California can result in breathing pattern changes, reduction of breathing capacity, increased susceptibility to infections, inflammation of the lung tissue and some immunological changes.

NO₂, like O₃, is not directly emitted into the atmosphere but is formed by an atmospheric chemical reaction between nitric oxide (NO) and atmospheric oxygen. NO and NO₂ are collectively referred to as NO_X and are major contributors to O₃ formation. NO₂ also contributes to the formation of PM₁₀. High concentrations of NO₂ can cause breathing difficulties and result in a brownish-red cast to the atmosphere with reduced visibility. There is some indication of a relationship between NO₂ and chronic pulmonary fibrosis. Some increase of bronchitis in children (two and three years old) has also been observed at concentrations below 0.3 ppm.

SO₂ is a colorless, pungent gas formed primarily by the combustion of sulfur-containing fossil fuels. Main sources of SO₂ are coal and oil used in power plants and industries. Generally, the highest levels of SO₂ are found near large industrial complexes. In recent years, SO₂ concentrations have been reduced by the increasingly stringent controls placed on stationary source emissions of SO₂ and limits on the sulfur content of fuels. SO₂ is an irritant gas that attacks the throat and lungs. It can cause acute respiratory symptoms and diminished ventilator function in children. SO₂ can also yellow plant leaves and erode iron and steel. Sulfur oxide (SO_X) refers to any of several compounds of sulfur and oxygen, the most important of which is SO₂.

Particulate matter pollution consists of very small liquid and solid particles floating in the air, which can include smoke, soot, dust, salts, acids, and metals. Particulate matter also forms when gases emitted from industries and motor vehicles undergo chemical reactions in the atmosphere. PM_{2.5} and PM₁₀ represent fractions of particulate matter. Fine particulate matter, or PM_{2.5}, is roughly 1/28 the diameter of a human hair. PM_{2.5} results from fuel combustion (e.g. motor vehicles, power generation, and industrial facilities), residential fireplaces, and wood stoves. In addition, PM_{2.5} can be formed in the atmosphere from gases such as SO₂, NO_X, and VOC. Inhalable particulate matter, or PM₁₀, is about 1/7 the thickness of a human hair. Major sources of PM₁₀ include crushing or grinding operations; dust stirred up by vehicles traveling on roads; wood burning stoves and fireplaces; dust from construction, landfills, and agriculture; wildfires and brush/waste burning; industrial sources; windblown dust from open lands; and atmospheric chemical and photochemical reactions.

PM_{2.5} and PM₁₀ pose a greater health risk than larger-size particles. When inhaled, these tiny particles can penetrate the human respiratory system's natural defenses and damage the respiratory tract. PM_{2.5} and PM₁₀ can increase the number and severity of asthma attacks, cause or aggravate bronchitis and other lung diseases, and reduce the body's ability to fight infections. Very small particles of substances, such as lead, sulfates, and nitrates can cause lung damage directly. These substances can be absorbed into the blood stream and cause damage elsewhere in the body. These substances can transport absorbed gases, such as chlorides or ammonium, into the lungs and cause injury. Whereas PM₁₀ tends to collect in the upper portion of the respiratory system, PM_{2.5} is so tiny that it can penetrate deeper into the lungs and

damage lung tissues. Suspended particulates also damage and discolor surfaces on which they settle, as well as produce haze and reduce regional visibility.

Lead in the atmosphere occurs as particulate matter. Sources of lead include leaded gasoline; the manufacturers of batteries, paint, ink, ceramics, and ammunition; and secondary lead smelters. Prior to 1978, mobile emissions were the primary source of atmospheric lead. Between 1978 and 1987, the phase-out of leaded gasoline reduced the overall inventory of airborne lead by nearly 95 percent. With the phase-out of leaded gasoline, secondary lead smelters, battery recycling, and manufacturing facilities have become lead-emission sources of greater concern. Prolonged exposure to atmospheric lead poses a serious threat to human health. Health effects associated with exposure to lead include gastrointestinal disturbances, anemia, kidney disease, and in severe cases, neuromuscular and neurological dysfunction. Of particular concern are low-level lead exposures during infancy and childhood. Such exposures are associated with decrements in neurobehavioral performance, including intelligence quotient performance, psychomotor performance, reaction time, and growth.

Toxic Air Contaminants (TACs) are generally defined as those contaminants that are known or suspected to cause serious health problems, but do not have a corresponding ambient air quality standard. TACs are also defined as an air pollutant that may increase a person's risk of developing cancer and/or other serious health effects; however, the emission of a toxic chemical does not automatically create a health hazard. Other factors, such as the amount of the chemical; its toxicity, and how it is released into the air, the weather, and the terrain, all influence whether the emission could be hazardous to human health. TACs are emitted by a variety of industrial processes such as petroleum refining, electric utility and chrome plating operations, commercial operations such as gasoline stations and dry cleaners, and motor vehicle exhaust and may exist as PM₁₀ and PM_{2.5} or as vapors (gases). TACs include metals, other particles, gases absorbed by particles, and certain vapors from fuels and other sources.

The emission of toxic substances into the air can be damaging to human health and to the environment. Human exposure to these pollutants at sufficient concentrations and durations can result in cancer, poisoning, and rapid onset of sickness, such as nausea or difficulty in breathing. Other less measurable effects include immunological, neurological, reproductive, developmental, and respiratory problems. Pollutants deposited onto soil or into lakes and streams affect ecological systems and eventually human health through consumption of contaminated food. The carcinogenic potential of TACs is a particular public health concern because many scientists currently believe that there is no "safe" level of exposure to carcinogens. Any exposure to a carcinogen poses some risk of contracting cancer.

4.12.1 | Regulatory Setting

4.12.1.1 | CRITERIA POLLUTANTS AND TOXIC AIR CONTAMINANTS

4.12.1.1.1 FEDERAL

United States Environmental Protection Agency

The Federal Clean Air Act (CAA) governs air quality in the United States. The United States Environmental Protection Agency (USEPA) is responsible for

enforcing the CAA. USEPA is also responsible for establishing the National Ambient Air Quality Standards (NAAQS). NAAQS are required under the 1977 CAA and subsequent amendments. USEPA regulates emission sources that are under the exclusive authority of the federal government, such as aircraft, ships, and certain types of locomotives. USEPA has jurisdiction over emission sources outside state waters (e.g., beyond the outer continental shelf) and establishes various emission standards, including those for vehicles sold in states other than California.¹

Under the CAA, NAAQS have been established for seven major air pollutants:

- carbon monoxide (CO)
- ozone (O₃)
- nitrogen dioxide (NO₂)
- sulfur dioxide (SO₂)
- particulate matter 2.5 microns or less in diameter (PM_{2.5})
- particulate matter 10 microns or less in diameter (PM₁₀)
- lead (Pb)

The CAA requires USEPA to designate areas as attainment, nonattainment, or maintenance (previously nonattainment and currently attainment) for each criteria pollutant based on whether the NAAQS have been achieved. The federal standards are summarized in Table 4.12-1. The USEPA has classified the Basin as attainment for SO₂, maintenance for CO and nonattainment for O₃, PM_{2.5}, and PM₁₀.

Title III of the FCAAA requires the USEPA to promulgate national emissions standards for hazardous air pollutants (NESHAPs). The NESHAP may differ for major sources than for area sources of hazardous air pollutants (HAPs) (major sources are defined as stationary sources with potential to emit more than 10 tons per year (TPY) of any HAP or more than 25 TPY of any combination of HAPs; all other sources are considered area sources). The emissions standards are to be promulgated in two phases. In the first phase (1992 to 2000), the USEPA developed technology-based emission standards designed to produce the maximum emission reduction achievable. These standards are generally referred to as requiring Maximum Achievable Control Technology (MACT). These federal rules are also commonly referred to as MACT standards, because they reflect the MACT. For area sources, the standards may be different, based on generally available control technology. In the second phase (2001 to 2008), the USEPA is required to promulgate health risk-based emissions standards where deemed necessary to address risks remaining after implementation of the technology-based NESHAP standards.

¹ Automobiles sold in California must meet stricter emission standards established by California Air Resources Board (CARB).

Table 4.12-1 State and National Ambient Air Quality Standards and Attainment Status for the Bay Area Air Basin

		FEDERAL (NAAQS)		CALIFORNIA	
POLLUTANT	AVERAGING PERIOD	STANDARDS	ATTAINMENT STATUS	STANDARDS	ATTAINMENT STATUS
Ozone	1-hour	No federal standard	No federal standard	0.09 ppm (180 μg/m³)	Nonattainment
Ozone	8-hour	0.075 ppm (147 μg/m³)	Nonattainment	0.070 ppm (137 μg/m³)	Nonattainment
Respirable	24-hour	150 µg/m³	Unclassified	50 μg/m³	Nonattainment
particulate matter (PM ₁₀)	Annual Arithmetic Mean	No federal standard	No federal standard	20 μg/m³	Nonattainment
Fine particulate	24-hour	35 μg/m³	Nonattainment	No state standard	No state standard
matter (PM _{2.5})	Annual Arithmetic Mean	12 μg/m³	Attainment	12 μg/m³	Nonattainment
6 1	8-hour	9 ppm (10 mg/m³)	Attainment/ Maintenance	9.0 ppm (10 mg/m³)	Attainment
Carbon monoxide	1-hour	35 ppm	Attainment/	20 ppm	Attainment
oouc	1-110ui	(40 mg/m ³)	Maintenance	(23 mg/m ³)	Accamment
Nitrogen	Annual Arithmetic Mean	53 ppb (100 μg/m³)	Attainment	0.030 ppm (57 μg/m³)	Attainment
dioxide	1-hour	100 ppb (188 μg/m³) /a/	Unclassified	0.18 ppm (338 μg/m³)	Attainment
Sulfur dioxide	24-hour	0.14 ppm (365 µg/m³)	Attainment	0.04 ppm (105 µg/m³)	Attainment
	1-hour	75 ppb (196 µg/m³)	Attainment	0.25 ppm (655 μg/m³)	Attainment
	30-day average		Attainment	1.5 μg/m³	Attainment
Lead	Calendar Quarter	1.5 μg/m³	Attainment	No state standard	No state standard
	Rolling 3- Month Average	0.15 μg/m³		No state standard	No state standard
Visibility reducing particles	8-hour	No federal standard		Extinction coefficient of 0.23 per kilometer	Unclassified
Sulfates	24-hour	No federal standard		25 μg/m³	Attainment
Hydrogen sulfide	1-hour	No federal standard		0.03 ppm (42 μg/m³)	Unclassified

The CAA requires the USEPA to promulgate vehicle or fuel standards containing reasonable requirements that control toxic emissions, at a minimum to benzene and formaldehyde. Performance criteria were established to limit mobile-source emissions of toxics, including benzene, formaldehyde, and 1,3-butadiene. In addition, Section 219 of the CAA requires certain urban bus systems (those in areas with the most severe ozone nonattainment conditions) to use reformulated gasoline to further reduce mobile-source emissions.

The U.S. Supreme Court has ruled² that carbon dioxide (CO₂), a greenhouse gas (GHG) is also an air pollutant as defined under the CAA, and that USEPA has the authority to regulate emissions of GHGs. Further discussion federal regulations on GHG follows below.

Transportation Conformity

Transportation conformity is an analysis required under CAA section 176(c) (42 U.S.C. 7506(c)) to ensure that federally supported highway and transit project activities are consistent with the purpose of the state Implementation Plan (SIP). Regional conformity for a given project is analyzed by discussing if the proposed project is included in a conforming Regional Transportation Plan (RTP) or Transportation Improvement Plan (TIP) with substantially the same design concept and scope that was used for the regional conformity analysis. Project level conformity is analyzed by discussing if the proposed project would cause localized exceedances of carbon monoxide, PM_{2.5}, and/or PM₁₀ standards, or if it would interfere with "timely implementation" of Transportation Control Measures called out in the State Implementation Plan (SIP).

Mobile Source Air Toxics (MSAT)

In addition to NAAQS for criteria pollutants, the CAA identified a list of 188 urban air toxics, alternatively known as toxic air contaminants (TACs). In its final ruling in March 2001, EPA narrowed this list to a group of 21 mobile-source air toxics (MSAT).³ From this list of 21 MSATs, EPA identified six priority MSATs: benzene, formaldehyde, acetaldehyde, diesel particulate matter/diesel exhaust organic gases, acrolein, and 1,3-butadiene. To address emissions of MSATs, EPA has introduced a number of measures targeting cleaner fuels and cleaner engines.

In March 2001, EPA issued regulations requiring the producers of urban air toxics to decrease emissions of these pollutants by target dates in 2007 and 2020. As a result, on-highway emissions of benzene, formaldehyde, 1,3-butadiene and acetaldehyde will be reduced by amounts ranging from 67 percent to 76 percent between 1990 and 2020. On-highway diesel particulate matter (DPM) emissions will be reduced by 90 percent. These reductions are expected as a result of the national mobile source control programs, including:

- The reformulated gasoline program;
- A new threshold for the toxic content of gasoline;
- The national low emission vehicle standards;
- The Tier 2 motor vehicle emissions standards and gasoline sulfur control requirements; and
- The heavy duty engine and vehicle standards; and on-highway diesel fuel sulfur control requirements.

The predicated improvements are net emission reductions, which will be experienced even after growth in vehicle miles traveled (VMT) is taken into account.

² Massachusetts v. Environmental Protection Agency ([2007] 549 U.S. 05-1120)

³ Control of Emissions of Hazardous Air Pollutants from Mobile Sources, 66 F.R. 17235

Mandatory Greenhouse Gas Reporting Rule

In 2009, USEPA issued a final rule for mandatory reporting of GHGs from large GHG emissions sources in the United States. In general, this national reporting requirement will provide USEPA with accurate and timely GHG emissions data from facilities that emit 25,000 metric tons or more of carbon dioxide per year. This publically available data will allow the reporters to track their own emissions, compare them to similar facilities, and aid in identifying cost effective opportunities to reduce emissions in the future. Reporting is at the facility level, except that certain suppliers of fossil fuels and industrial greenhouse gases along with vehicle and engine manufacturers will report at the corporate level. An estimated 85 percent of the total US GHG emissions, from approximately 10,000 facilities, are covered by this final rule.⁴

Endangerment and Cause or Contribute Findings for Greenhouse Gases under Clean Air Act Section 202(a)

In December 2009, the EPA Administrator signed two distinct findings regarding greenhouse gases under Section 202(a) of the Clean Air Act.

Endangerment Finding: The Administrator found that the current and projected concentrations of the six key GHGs (i.e., carbon dioxide, methane, nitrogen dioxide, hydrofluorocarbons, perflurorocarbons, and sulfur hexafluoride) in the atmosphere threaten the public health and welfare of current and future generations.

Cause or Contribute Finding: The Administrator found that the combined emissions of these GHGs from new motor vehicles and motor vehicle engines contribute to the GHG pollution which threatens public health and welfare.

These finding were necessary prerequisites for implementing emissions standards for vehicles. In collaboration with the National Highway Traffic Safety Administration (NHTSA), EPA finalized emission standards for light-duty vehicles (2012-2016 model years) in May of 2010 and heavy-duty vehicles (2014-2018 model years) in August of 2011.

Council on Environmental Quality Guidelines

The Council on Environmental Quality (CEQ) has provided a draft guidance memorandum on the ways in which federal agencies can improve their consideration of the effects GHG emissions in NEPA documents.⁵ The guidance states that direct emissions from a proposed action of 25,000 metric TPY of carbon dioxide equivalent (or CO₂e) can be used as indicator that a quantitative and qualitative assessment may be meaningful to decision makers.

⁴BAAQMD, CEQA Air Quality Guidelines, June 2010.

⁵Council on Environmental Quality, Draft NEPA Guidance on Consideration of the Effects of Climate Change and Greenhouse Gas Emissions, February 18, 2010.

4.12.1.1.2 STATE

California Air Resources Board

In addition to being subject to the requirements of CAA, air quality in California is also governed by more stringent regulations under the California Clean Air Act (CCAA). In California, the CCAA is administered by the California Air Resources Board (CARB) at the state level and by the air quality management districts and air pollution control districts at the regional and local levels. The CARB, which became part of the California Environmental Protection Agency in 1991, is responsible for meeting the state requirements of the CAA, administering the CCAA, and establishing the California Ambient Air Quality Standards (CAAQS). The CCAA, as amended in 1992, requires all air districts in the state to endeavor to achieve and maintain the CAAQS. CAAQS are generally more stringent than the corresponding federal standards and incorporate additional standards for sulfates, hydrogen sulfide, vinyl chloride, and visibility-reducing particles. CARB regulates mobile air pollution sources, such as motor vehicles. CARB is responsible for setting emission standards for vehicles sold in California and for other emission sources, such as consumer products and certain off-road equipment. CARB established passenger vehicle fuel specifications, which became effective in March 1996. CARB oversees the functions of local air pollution control districts and air quality management districts, which, in turn, administer air quality activities at the regional and county levels. The state standards are summarized in Table 4.12-1.

The CCAA requires CARB to designate areas within California as either attainment or non-attainment for each criteria pollutant based on whether the CAAQS have been achieved. Under the CCAA, areas are designated as non-attainment for a pollutant if air quality data shows that a state standard for the pollutant was violated at least once during the previous three calendar years. Exceedances that are affected by highly irregular or infrequent events are not considered violations of a State standard and are not used as a basis for designating areas as nonattainment. Under the CCAA, the San Francisco County portion of the Basin is designated as a nonattainment area for O₃, PM_{2.5}, and PM_{10.6}

State Toxic Air Contaminant Programs

California regulates Toxic Air Contaminants (TACs) primarily through the Tanner Air Toxics Act (AB 1807) and the Air Toxics Hot Spots Information and Assessment Act of 1987 (AB 2588).

AB1807 sets forth a formal procedure for CARB to designate substances as TACs. This includes research, public participation, and scientific peer review before CARB can designate a substance as a TAC. To date, CARB has identified over 21 TACs, and adopted the USEPA's list of HAPs as TACs. Most recently, diesel exhaust particulate was added to the CARB list of TACs. Once a TAC is identified, CARB's then adopts an Airborne Toxics Control Measure for sources that emit that particular TAC. None of the TACs identified by CARB have a "safe threshold;" exposure to these TACs is therefore considered in terms of long-term elevated health risk.

⁶CARB, *Area Designation Maps*, available at http://www.arb.ca.gov/desig/adm/adm.htm, accessed March 19, 2012.

The Hot Spots Act (AB 2588) requires that existing facilities that emit toxic substances above specified levels:

- Prepare a toxic emission inventory;
- Prepare a risk assessment if emissions are significant;
- · Notify the public of significant risk levels; and
- Prepare and implement risk reduction measures.

CARB has adopted diesel exhaust control measures and more stringent emission standards for various on-road mobile sources of emissions, including transit buses and off-road diesel equipment (e.g., tractors, generators).

In February 2000, CARB adopted a new public transit bus fleet rule and emission standards for new urban buses. These rules and standards provide for more stringent emission standards for some new urban bus engines beginning with 2002 model year engines, zero-emission bus demonstration and purchase requirements applicable to transit agencies, and reporting requirements with which transit agencies must demonstrate compliance with the urban transit bus fleet rule. Milestones include the low sulfur diesel fuel requirement, and tighter emission standards for heavy-duty diesel trucks (2007) and off-road diesel equipment (2011) nationwide.

Over time, the replacement of older vehicles will result in a vehicle fleet that produces substantially less TACs than under current conditions. Mobile-source emissions of TACs (e.g., benzene, 1-3-butadiene, diesel PM) have been reduced significantly over the last decade, and will be reduced further in California through a progression of regulatory measures (e.g., Low Emission Vehicle/Clean Fuels and Phase II reformulated gasoline regulations) and control technologies. With implementation of CARB's Risk Reduction Plan, it is expected that diesel PM concentrations will be reduced by 85 percent in 2020 from the estimated year 2000 levels. Adopted regulations are also expected to continue to reduce formaldehyde emissions from cars and light-duty trucks. As emissions are reduced, it is expected that risks associated with exposure to the emissions will also be reduced.

Assembly Bill 1493 (AB 1493)

AB 1493 requires the development and adoption of regulations to achieve "the maximum feasible reduction of greenhouse gases" emitted by noncommercial passenger vehicles, light-duty trucks, and other vehicles used primarily for personal transportation in the state. In 2009, CARB adopted amendments to the AB 1493 regulations that reduce greenhouse gas (GHG) emissions in new passenger vehicles from 2009 through 2016. These amendments are part of California's commitment toward a nation-wide program to reduce new passenger vehicle GHGs from 2012 through 2016.

Executive Order (E.O.) S-3-05

This order established state GHG emission targets of 1990 levels by 2020 (the same as AB 32, enacted later and discussed below) and 80 percent below 1990 levels by 2050. It calls for the Secretary of the Cal/EPA to be responsible for coordination of state agencies and progress reporting.

⁷BAAQMD, CEQA Air Quality Guidelines, June 2010.

In response to the E.O., the Secretary of the Cal/EPA created the Climate Action Team (CAT). California's CAT originated as a coordinating council organized by the Secretary for Environmental Protection.

Assembly Bill 32 (AB 32), California Global Warming Solutions Act of 2006

AB 32 focuses on reducing GHG emissions in California, and requires CARB to adopt rules and regulations that would achieve greenhouse gas emissions equivalent to statewide levels in 1990 by 2020. To achieve this goal, AB 32 mandates that CARB establish a quantified emissions cap, institute a schedule to meet the cap, implement regulations to reduce statewide GHG emissions from stationary sources, and develop tracking, reporting, and enforcement mechanisms to ensure that reductions are achieved. Because the intent of AB 32 is to limit 2020 emissions to the equivalent of 1990, it is expected that the regulations would affect many existing sources of GHG emissions and not just new general development projects.

AB 32 charges CARB with the responsibility to monitor and regulate sources of GHG emissions in order to reduce those emissions. In 2007, CARB adopted a series of early action measures to reduce GHG emissions. Among these, transportation-related measures included complying with a low carbon fuel standard, reducing refrigerant loss from motor vehicle air conditioning maintenance, and promoting proper tire inflation in vehicles.

CARB has determined that the total statewide aggregated GHG 1990 emissions level and 2020 emissions limit is 427 million metric tons of CO₂e. The 2020 target reductions are currently estimated to be 174 million metric tons of CO₂e.

AB 32 Climate Change Scoping Plan

The CARB AB 32 Scoping Plan contains the main strategies to achieve the 2020 emissions cap. The Scoping Plan was developed by CARB with input from CAT and proposes a comprehensive set of actions designed to reduce overall carbon emissions in California, improve the environment, reduce oil dependency, diversify energy sources, and enhance public health while creating new jobs and improving the state economy. The GHG reduction strategies contained in the Scoping Plan include direct regulations, alternative compliance mechanisms, monetary and non-monetary incentives, voluntary actions, and market-based mechanisms such as a capand-trade system. Two of several key approaches for reducing greenhouse gas emissions to 1990 levels by 2020 include:

- Establishing targets for transportation-related GHG emissions for regions throughout California, and pursuing policies and incentives to achieve those targets; and
- Adopting and implementing measures to reduce transportation sector emissions, including California's.

CARB has also developed the GHG mandatory reporting regulation, which required reporting beginning on January 1, 2008 pursuant to requirements of AB 32. The regulations require reporting for certain types of facilities that make up the bulk (up to 94 percent) of the stationary source emissions in California.

In February 2014, CARB published a draft Proposed First Update to the Climate Change Scoping Plan. This Update identifies the next steps for California's leadership on climate change.

As part of the Update, CARB is proposing to revise the 2020 statewide limit to 431 million metric tons of CO₂e, an approximately one percent increase from the original estimate. The 2020 business-as-usual (BAU) forecast in the Update is 509 million metric tons of CO₂e. The state would need to reduce those emissions by 15 percent to meet the new limit of 431 million metric tons.

Executive Order (E.O.) S-1-07

This E.O. established a Low-Carbon Fuel Standard (LCFS) and directed the Secretary for Environmental Protection to develop and propose protocols for measuring the "life-cycle carbon intensity" of transportation fuels.

4.12.1.1.3 REGIONAL

The Bay Area Air Quality Management District (BAAQMD) attains and maintains air quality conditions in the San Francisco Bay Area Air Basin (SFBAAB) through a comprehensive program of planning, regulation, enforcement, technical innovation, and promotion of the understanding of air quality issues. BAAQMD has jurisdiction over an approximately 5,600-square-mile area of the San Francisco Bay Area (Bay Area), including all of San Francisco County.

The BAAQMD established a climate protection program to reduce pollutants that contribute to global climate change and affect air quality in the Air Basin. The climate protection program includes measures that promote energy efficiency, reduce vehicle miles traveled, and develop alternative sources of energy all of which assist in reducing emissions of GHG and in reducing air pollutants that affect the health of residents. BAAQMD also seeks to support current climate protection programs in the region and to stimulate additional efforts through public education and outreach, technical assistance to local governments and other interested parties, and promotion of collaborative efforts among stakeholders.

The clean air strategy of the BAAQMD includes the preparation of plans for the attainment of ambient air quality standards, adoption and enforcement of rules and regulations concerning sources of air pollution, and issuance of permits for stationary sources of air pollution. The BAAQMD also inspects stationary sources of air pollution and responds to citizen complaints, monitors ambient air quality and meteorological conditions, and implements programs and regulations required by the CAA and the CCAA.

The BAAQMD last updated its CEQA Guidelines between 2009 and 2011. This is an advisory document that offers guidance to the Lead Agency, consultants, and project applicants for addressing air quality in environmental documents.⁸

⁸ The preparers of this EIR/EIS have reviewed the evidence used to formulate the BAAQMD CEQA Guidelines including BAAQMD's May 2010 staff report recommending the adoption of the thresholds and its attachments, and conclude that substantial evidence supports the continued use of BAAQMD's 2010 thresholds of significance as thresholds of significance for air quality and greenhouse gas impacts in this EIR.

The handbook contains the following applicable components:

- Criteria and thresholds for determining whether a project may have a significant adverse air quality impact;
- Specific procedures and modeling protocols for quantifying and analyzing air quality impacts;
- · Methods available to mitigate air quality impacts; and
- Information for use in air quality assessments and environmental documents that will be updated more frequently such as air quality data, regulatory setting, climate, and topography.

BAAQMD has jurisdiction over an approximately 5,600-square-mile area of the San Francisco Bay Area. This area includes all of Alameda County, Contra Costa County, Marin County, San Francisco County, San Mateo County, Santa Clara County, and Napa County, the southwestern portion of Solano County and the southern portion of Sonoma County.

As stated above, the BAAQMD prepares plans to attain ambient air quality standards in the Air Basin. The BAAQMD prepares ozone attainment plans (OAP) for the national ozone standard and clean air plans (CAP) for the California standard both in coordination with the Metropolitan Transportation Commission (MTC) and the Association of Bay Area Governments (ABAG). With respect to applicable air quality plans, the BAAQMD prepared the 2010 Clean Air Plan (CAP) to address nonattainment of the national one- and eight-hour ozone standard in the Air Basin. The three purposes of the 2010 CAP are to: 1) reduce emissions and decrease ambient concentrations of harmful pollutants, 2) safeguard public health by reducing exposure to air pollutants that pose the greatest health risk, and 3) reduce greenhouse gas emissions to protect the climate. To achieve the three core purposes of the 2010 CAP, the control strategy proposes are designed to:

- Reduce emissions of ozone precursors, PM, air toxics, and greenhouse gases;
- Continue progress toward attainment of state ozone standards;
- Reduce transport of ozone precursors to neighboring air basins;
- Protect public health by reducing population exposure to the most harmful air pollutants; and
- Protect the climate.

Similarly, the BAAQMD prepared the 2010 CAP to address nonattainment of the CAAQS.

The BAAQMD has regulated TACs since the 1980s. At the local level, air pollution control or management districts may adopt and enforce CARB's control measures. Under BAAQMD Regulation 2-1 (General Permit Requirements), Regulation 2-2 (New Source Review), and Regulation 2-5 (New Source Review of Toxic Air Contaminants), all nonexempt sources that possess the potential to emit TACs are required to obtain permits from BAAQMD. Permits may be granted to these operations if they are constructed and operated in accordance with applicable regulations, including new source review standards and air toxics control measures. The BAAQMD limits emissions and public exposure to TACs through a number of

programs. The BAAQMD prioritizes TAC-emitting stationary sources based on the quantity and toxicity of the TAC emissions and the proximity of the facilities to sensitive receptors.

Naturally occurring asbestos (NOA) was identified as a TAC in 1986 by CARB. NOA is located in many parts of California and is commonly associated with ultramafic rocks, according to the California Department of Geology's special publication titled Guidelines for Geologic Investigations of Naturally Occurring Asbestos in California. BAAQMD's NOA program requires that the applicable notification forms from the Air District's website be submitted by qualifying operations in accordance with the procedures detailed in the air toxics control measures (ATCM) Inspection Guidelines Policies and Procedures. The Lead Agency shall reference BAAQMD's ATCM Policies and Procedures to determine which NOA Notification Form is applicable to the proposed project (NOA Notification Forms). The ATCM requires regulated operations engaged in road construction and maintenance activities, construction and grading operations, and quarrying and surface mining operations in areas where NOA is likely to be found, to employ the best available dust mitigation measures to reduce and control dust emissions.

In addition, the BAAQMD has adopted Regulation 11, Rule 2 which addresses asbestos demolition renovation, manufacturing, and standards for asbestos containing serpentine (Appendix F). The purpose of Regulation 11, Rule 2 is to control emissions of asbestos to the atmosphere during demolition, renovation, milling and manufacturing and establish appropriate waste disposal procedures.¹⁰ Some of the regulations listed in Regulation 11, Rule 2 include:

 Visible Emissions: There shall be no visible emissions to the outside air from any asbestos mill or from any operation involving the demolition, renovation, removal, manufacture or fabrication of any product containing asbestos.

Demolition, Renovation, and Removal: To prevent emissions from asbestos containing material, a person responsible for scheduled, nonscheduled, or emergency demolition, renovation, or removal of any building elements containing any amount of RACM shall use the procedures specified in subsections 303.1 through 303.13. This shall not apply to maintenance or decontamination procedures where no removal takes place.

• *Waste Disposal:* To prevent emissions from asbestos-containing material, a person responsible for the collection, processing (including incineration and conversion), packaging, transporting, or disposition of any asbestos-containing waste material which is generated by manufacturing; fabricating; scheduled, nonscheduled, or emergency demolition or renovation, whether notified or not; spraying operations; or asbestos milling, shall use procedures specified in Regulation 11, Rule 2, Standard 304.

• Waste Disposal Sites: There shall be no visible emissions to the outside air from a waste disposal site where asbestos-containing waste material has been or is being deposited.

4.12.1.1.4 LOCAL

San Francisco General Plan Air Quality Element

The San Francisco General Plan includes the 1997 Air Quality Element.¹¹ Relevant objectives include the following:

Objective 1:	Adhere to state and federal standards and regional programs.
Objective 2:	Reduce mobile sources of air pollution through implementation of the
	Transportation Element of the San Francisco General Plan.
Objective 3:	Decrease the air quality impacts of development by coordination of
	land use and transportation decisions.
Objective 4:	Improve air quality by increasing public awareness regarding the
	negative health effects of pollutants generated by stationary and
	mobile sources.

Objective 5: Minimize particulate matter emissions from road and construction sites.

Objective 6: Link the positive effects of energy conservation and waste management to emission reductions.

San Francisco Health Code Construction Dust Control Ordinance

The San Francisco Health Code Article 22B and San Francisco Building Code §106A.3.2.6 collectively constitute the City's Construction Dust Control Ordinance (adopted in July 2008). The Construction Dust Control Ordinance requires that all site preparation work, demolition, or other construction activities within the City that have the potential to create dust or to expose or disturb more than 10 cubic yards or 500 square feet of soil comply with specific dust control measures whether or not the activity requires a permit from the Department of Building Inspection (DBI). For projects over one-half acre, the Construction Dust Control Ordinance requires that the project sponsor submit a Dust Control Plan for approval by the San Francisco Department of Public Health (DPH) prior to issuance of a building permit by the DBI.

The Construction Dust Control Ordinance requires project sponsors and contractors responsible for construction activities to control construction dust on the site or implement other practices that result in equivalent dust control that are acceptable to the Director of Public Health. Dust suppression activities, referred to as best management practices (BMPs), may include watering all active construction areas sufficiently to prevent dust from becoming airborne; increased watering frequency may be necessary whenever wind speeds exceed 15 miles per hour. Reclaimed water must be used if required by Article 21, §1100 et seq. of the San Francisco Public Works Code. The Construction Dust Control Ordinance has a mandate for "no visible dust." Section 1247 of Article 22B of the Public Health Code requires that all City Agencies that authorize construction or other improvements on City property adopt rules and regulations to ensure that the dust

¹¹City and County of San Francisco, San Francisco General Plan, Air Quality Element, 1997, updated 2000, available online at: http://www.sf-planning.org/ftp/General_Plan/I10_Air_Quality.htm, accessed October 16, 2013.

control requirements identified in Article 22B are followed. The BMPs employed in compliance with the City's Construction Dust Control Ordinance provide an effective strategy for controlling fugitive dust. Since the proposed project would be required to comply with the Construction Dust Control Ordinance, particulate matter from fugitive dust is not quantified for this EIR.

San Francisco Health Code Clean Construction Ordinance

Section 6.25 of Chapter 6 of the San Francisco Administrative Code (Clean Construction Ordinance) requires clean construction practices for all City projects that consist of 20 or more cumulative days of construction. The Clean Construction Ordinance requires that off-road equipment and off-road engines with 25 horsepower or greater: 1) be fueled by biodiesel fuel grade B20 or higher; and 2) if used more than 20 hours, either meet or exceed Tier 2 emissions standards39 for off-road engines or operate with the most effective verified diesel emission control technology. The requirement does not apply to portable or stationary generators (engines).

4.12.2 | Affected Environment

4.12.2.1 | AIR POLLUTION CLIMATOLOGY

The SFBAAB is characterized by complex terrain, consisting of coastal mountain ranges, inland valleys, and bays, which distort normal wind flow patterns. The climate is dominated by the strength and location of a semi-permanent, subtropical high pressure cell. During the summer, the Pacific high pressure cell is centered over the northeastern Pacific Ocean resulting in stable meteorological conditions and a steady northwesterly wind flow. Upwelling of cold ocean water from below to the surface because of the northwesterly flow produces a band of cold water off the California coast. The cool and moisture-laden air approaching the coast from the Pacific Ocean is further cooled by the presence of the cold water band resulting in condensation and the presence of fog and stratus clouds along the Northern California coast. Generally in the winter, the Pacific high weakens and shifts southward, winds tend to flow offshore, upwelling ceases and storms occur. During the winter rainy periods, inversions (layers of warmer air over colder air; see below) are weak or nonexistent, winds are usually moderate and air pollution potential is low. The Pacific high does periodically become dominant, bringing strong inversions, light winds and high pollution potential.

4.12.2.1.1 TOPOGRAPHY

The topography of the SFBAAB is characterized by complex terrain, consisting of coastal mountain ranges, inland valleys and bays. This complex terrain, especially the higher elevations, distorts the normal wind flow patterns in the SFBAAB. The greatest distortion occur when low-level inversions are present and the air beneath the inversion flows independently of air above the inversion, a condition that is common in the summer time.

The only major break in California's Coast Range occurs in the SFBAAB. Here the Coast Range splits into western and eastern ranges. Between the two ranges lies San Francisco Bay. The gap in the western coast range is known as the Golden Gate Bridge and the gap in the eastern coast range is the Carquinez Strait. These gaps allow air to pass into and out of the SFBAAB and the Central Valley.

4.12.2.1.2 WIND PATTERNS

During the summer, winds flowing from the northwest are drawn inland through the Golden Gate and over the lower portions of the San Francisco Peninsula. Immediately south of Mount Tamalpais, the northwesterly winds accelerate considerably and come more directly from the west as they stream through the Golden Gate. This channeling of wind through the Golden Gate produces a jet that sweeps eastward and splits off to the northwest toward Richmond and to the southwest toward San Jose when it meets the East Bay hills.

Wind speeds may be strong locally in areas where air is channeled through a narrow opening, such as the Carquinez Strait, the Golden Gate or the San Bruno gap. For example, the average wind speed at San Francisco International Airport in July is about 17 knots (from 3 p.m. to 4 p.m.), compared with only 7 knots at San Jose and less than 6 knots at the Farallon Islands. The air flowing in from the coast to the Central Valley, called the sea breeze, begins developing at or near ground level along the coast in late morning or early afternoon. As the day progresses, the sea breeze layer deepens and increases in velocity while spreading inland. The depth of the sea breeze depends in large part upon the height and strength of the inversion. If the inversion is low and strong, and hence stable, the flow of the sea breeze will be inhibited and stagnant conditions are likely to result.

In the winter, the SFBAAB frequently experiences stormy conditions with moderate to strong winds, as well as periods of stagnation with very light winds. Winter stagnation episodes are characterized by nighttime drainage flows in coastal valleys. Drainage is a reversal of the usual daytime air-flow patterns; air moves from the Central Valley toward the coast and back down toward the Bay from the smaller valleys within the Air Basin.

4.12.2.1.3 TEMPERATURE

The annual average temperature in the project area is 64°. The project area experiences an average winter temperature of approximately 50.5° and an average summer temperature of approximately 87°.

Summertime temperatures in the SFBAAB are determined in large part by the effect of differential heating between land and water surfaces. Because land tends to heat up and cool off more quickly than water, a large-scale gradient (differential) in temperature is often created between the coast and the Central Valley, and small-scale local gradients are often produced along the shorelines of the ocean and bays. The temperature gradient near the ocean is also exaggerated, especially in summer, because of the upwelling of cold ocean bottom water along the coast. On summer afternoons the temperatures at the coast can be 35°F cooler than temperatures 15 to 20 miles inland. At night this contrast usually decreases to less than 10°.

In the winter, the relationship of minimum and maximum temperatures is reversed. During the daytime the temperature contrast between the coast and inland areas is small, whereas at night the variation in temperature is large.

4.12.2.1.4 PRECIPITATION

Total precipitation in the project area averages approximately 24 inches annually. Precipitation occurs mostly during the winter and relatively infrequently during the summer. Precipitation averages approximately 15 inches during the winter,

approximately 5 inches during the spring, approximately 3 inches during the fall, and less than one inch during the summer.¹²

The SFBAAB is characterized by moderately wet winters and dry summers. Winter rains account for about 75 percent of the average annual rainfall. The amount of annual precipitation can vary greatly from one part of the SFBAAB to another even within short distances. In general, total annual rainfall can reach 40 inches in the mountains, but it is often less than 16 inches in sheltered valleys.

During rainy periods, ventilation (rapid horizontal movement of air and injection of cleaner air) and vertical mixing are usually high, and thus pollution levels tend to be low. However, frequent dry periods do occur during the winter where mixing and ventilation are low and pollutant levels build up.

4.12.2.1.5 AIR POLLUTION POTENTIAL

The potential for high pollutant concentrations developing at a given location depends upon the quantity of pollutants emitted into the atmosphere in the surrounding area or upwind, and the ability of the atmosphere to disperse the contaminated air. The topographic and climatological factors discussed above influence the atmospheric pollution potential of an area. Atmospheric pollution potential, as the term is used here, is independent of the location of emission sources and is instead a function of factors described below.

4.12.2.1.6 WIND CIRCULATION

Low wind speed contributes to the buildup of air pollution because it allows more pollutants to be emitted into the air mass per unit of time. Light winds occur most frequently during periods of low sun (fall and winter, and early morning) and at night. These are also periods when air pollutant emissions from some sources are at their peak, namely, commute traffic (early morning) and wood burning appliances (nighttime). The problem can be compounded in valleys, when weak flows carry the pollutants upvalley during the day, and cold air drainage flows move the air mass down-valley at night. Such restricted movement of trapped air provides little opportunity for ventilation and leads to buildup of pollutants to potentially unhealthful levels.

Wind-roses provide useful information for communities that contain industry, landfills or other potentially odorous or noxious land uses. Each wind-rose diagram provides a general indication of the proportion of time that winds blow from each compass direction. The longer the vector length, the greater the frequency of wind occurring from that direction. Such information may be particularly useful in planning buffer zones. For example, sensitive receptors such as residential developments, schools or hospitals are inappropriate uses immediately downwind from facilities that emit toxic or odorous pollutants, unless adequate separation is provided by a buffer zone. Caution should be taken in using wind-roses in planning and environmental review processes. A site on the opposite side of a hill or tall building, even a short distance from a meteorological monitoring station, may

¹²Western Regional Center, Historical Climate Information, available at http://www.wrcc.dri.edu, accessed October 4, 2011.

experience a significant difference in wind pattern. Consult BAAQMD meteorologists if more detailed wind circulation information is needed.

4.12.2.1.7 INVERSIONS

An inversion is a layer of warmer air over a layer of cooler air. Inversions affect air quality conditions significantly because they influence the mixing depth, i.e., the vertical depth in the atmosphere available for diluting air contaminants near the ground. The highest air pollutant concentrations in the SFBAAB generally occur during inversions.

There are two types of inversions that occur regularly in the SFBAAB. One is more common in the summer and fall, while the other is most common during the winter. The frequent occurrence of elevated temperature inversions in summer and fall months acts to cap the mixing depth, limiting the depth of air available for dilution. Elevated inversions are caused by subsiding air from the subtropical high pressure zone, and from the cool marine air layer that is drawn into the SFBAAB by the heated low pressure region in the Central Valley.

The inversions typical of winter, called radiation inversions, are formed as heat quickly radiates from the earth's surface after sunset, causing the air in contact with it to rapidly cool. Radiation inversions are strongest on clear, low-wind, cold winter nights, allowing the build-up of such pollutants as carbon monoxide and particulate matter. When wind speeds are low, there is little mechanical turbulence to mix the air, resulting in a layer of warm air over a layer of cooler air next to the ground. Mixing depths under these conditions can be as shallow as 50 to 100 meters, particularly in rural areas. Urban areas usually have deeper minimum mixing layers because of heat island effects and increased surface roughness. During radiation inversions downwind transport is slow, the mixing depths are shallow, and turbulence is minimal, all factors which contribute to ozone formation.

Although each type of inversion is most common during a specific season, either inversion mechanism can occur at any time of the year. Sometimes both occur simultaneously. Moreover, the characteristics of an inversion often change throughout the course of a day. The terrain of the SFBAAB also induces significant variations among subregions.

4.12.2.1.8 SOLAR RADIATION

The frequency of hot, sunny days during the summer months in the SFBAAB is another important factor that affects air pollution potential. It is at the higher temperatures that ozone is formed. In the presence of ultraviolet sunlight and warm temperatures, reactive organic gases and oxides of nitrogen react to form secondary photochemical pollutants, including ozone.

Because temperatures in many of the SFBAAB inland valleys are so much higher than near the coast, the inland areas are especially prone to photochemical air pollution. In late fall and winter, solar angles are low, resulting in insufficient ultraviolet light and warming of the atmosphere to drive the photochemical reactions. Ozone concentrations do not reach significant levels in the SFBAAB during these seasons.

4.12.2.1.9 SHELTERED TERRAIN

The hills and mountains in the SFBAAB contribute to the high pollution potential of some areas. During the day, or at night during windy conditions, areas in the lee sides of mountains are sheltered from the prevailing winds, thereby reducing turbulence and downwind transport. At night, when wind speeds are low, the upper atmospheric layers are often decoupled from the surface layers during radiation conditions. If elevated terrain is present, it will tend to block pollutant transport in that direction. Elevated terrain also can create a recirculation pattern by inducing upvalley air flows during the day and reverse downvalley flows during the night, allowing little inflow of fresh air.

The areas having the highest air pollution potential tend to be those that experience the highest temperatures in the summer and the lowest temperatures in the winter. The coastal areas are exposed to the prevailing marine air, creating cooler temperatures in the summer, warmer temperatures in winter, and stratus clouds all year. The inland valleys are sheltered from the marine air and experience hotter summers and colder winters. Thus, the topography of the inland valleys creates conditions conducive to high air pollution potential.

4.12.2.1.10POLLUTION POTENTIAL RELATED TO EMISSIONS

Although air pollution potential is strongly influenced by climate and topography, the air pollution that occurs in a location also depends upon the amount of air pollutant emissions in the surrounding area or transported from more distant places. Air pollutant emissions generally are highest in areas that have high population densities, high motor vehicle use and/or industrialization. These contaminants created by photochemical processes in the atmosphere, such as ozone, may result in high concentrations many miles downwind from the sources of their precursor chemicals.

4.12.2.2 | LOCAL CLIMATE

The peninsula region extends from northwest of San Jose to the Golden Gate. The Santa Cruz Mountains run up the center of the peninsula, with elevations exceeding 2000 feet at the southern end, decreasing to 500 feet in South San Francisco. Coastal towns experience a high incidence of cool, foggy weather in the summer. Cities in the southeastern peninsula experience warmer temperatures and fewer foggy days because the marine layer is blocked by the ridgeline to the west. San Francisco lies at the northern end of the peninsula. Because most of San Francisco's topography is below 200 feet, marine air is able to flow easily across most of the City, making its climate cool and windy.

The blocking effect of the Santa Cruz Mountains results in variations in summertime maximum temperatures in different parts of the peninsula. For example, in coastal areas and San Francisco the mean maximum summer temperatures are in the mid-60's, while in Redwood City the mean maximum summer temperatures are in the low-80's. Mean minimum temperatures during the winter months are in the high-30's to low-40's on the eastern side of the Peninsula and in the low 40's on the coast.

Two important gaps in the Santa Cruz Mountains occur on the peninsula. The larger of the two is the San Bruno Gap, extending from Fort Funston on the ocean to the San Francisco Airport. Because the gap is oriented in the same northwest to

southeast direction as the prevailing winds, and because the elevations along the gap are less than 200 feet, marine air is easily able to penetrate into the bay. The other gap is the Crystal Springs Gap, between Half Moon Bay and San Carlos. As the sea breeze strengthens on summer afternoons, the gap permits maritime air to pass across the mountains, and its cooling effect is commonly seen from San Mateo to Redwood City.

Annual average wind speeds range from 5 to 10 mph throughout the peninsula, with higher wind speeds usually found along the coast. Winds on the eastern side of the peninsula are often high in certain areas, such as near the San Bruno Gap and the Crystal Springs Gap. The prevailing winds along the peninsula's coast are from the west, although individual sites can show significant differences. For example, Fort Funston in western San Francisco shows a southwest wind pattern while Pillar Point in San Mateo County shows a northwest wind pattern. On the east side of the mountains winds are generally from the west, although wind patterns in this area are often influenced greatly by local topographic features.

Air pollution potential is highest along the southeastern portion of the peninsula. This is the area most protected from the high winds and fog of the marine layer. Pollutant transport from upwind sites is common. In the southeastern portion of the peninsula, air pollutant emissions are relatively high due to motor vehicle traffic as well as stationary sources. At the northern end of the peninsula in San Francisco, pollutant emissions are high, especially from motor vehicle congestion. Localized pollutants, such as carbon monoxide, can build up in "urban canyons." Winds are generally fast enough to carry the pollutants away before they can accumulate.

Within the proposed project site and its vicinity, the average wind speed, as recorded at the San Francisco/International Airport Wind Monitoring Station, is approximately 10 miles per hour. Wind in the vicinity of the proposed project site predominately blows from the northwest.

The annual average temperature in the Geary corridor, as recorded at the San Francisco Mission Dolores Station, is approximately 57°F. Geary corridor area experiences an average winter temperature of approximately 52°F and an average summer temperature of approximately 60°F. Total precipitation in the proposed project area averages approximately 21 inches annually. Precipitation occurs mostly during the winter and relatively infrequently during the summer.

4.12.2.3 | AIR QUALITY

The federal and state governments have established ambient air quality standards for outdoor concentrations of six common pollutants, called criteria pollutants, to protect public health. The criteria pollutant standards have been set at levels above which concentrations could be harmful to human health and welfare. These standards are designed to protect the most sensitive persons from illness or discomfort. Pollutants and effects overview

Other air quality issues of concern in the Air Basin include nuisance impacts of odors and dust. Objectionable odors may be associated with a variety of pollutants. Odors rarely have direct health impacts, but they can be unpleasant and can lead to

anger and concern over possible health effects among the public. Each year the BAAQMD receives thousands of citizen complaints about objectionable odors.¹³

Similarly, nuisance dust may be generated by a variety of sources including quarries, agriculture, grading and construction. Dust emissions can contribute to increased ambient concentrations of PM_{10} , and can also contribute to reduced visibility and soiling of exposed surfaces.

4.12.2.4 | AIR MONITORING DATA

BAAQMD monitors air quality conditions at 23 locations throughout the Bay Area. The nearest air monitoring station to the proposed project site is the San Francisco Arkansas Street Monitoring Station. The Arkansas Street Monitoring Station is approximately 7.7 miles from the intersection of 48th Avenue and Geary Boulevard, and 3.8 miles from the intersection of Divisadero Street and Geary Boulevard. The Arkansas Street Monitoring Station is representative of air quality conditions throughout the Geary corridor. Historical data from the Arkansas Street Monitoring Station was used to characterize existing conditions within the vicinity of the proposed project area and to establish a baseline for estimating future conditions with and without the proposed project. Table 4.12-2 shows air quality recorded during the 2009 to 2012 period.

Table 4.12-2 2009-2012 Ambient Air Quality Data in Project Vicinity

		NUMBER OF DAYS ABOVE STATE STANDA			
POLLUTANT	POLLUTANT CONCENTRATION & STANDARDS	2009	2010	2011	2012

SOURCE: CARB, Historical Data by Year, available at http://www.arb.ca.gov/adam/welcome.html, accessed January 7, 2014

The San Francisco Department of Public Health has created a map that displays PM_{2.5} concentrations resulting from vehicle emissions on City streets.¹⁴ The map shows potential roadway exposure zone, which means those areas within the City and County of San Francisco which, by virtue of their proximity to freeways and major roadways, may exhibit high PM_{2.5} concentration attributable to local roadway traffic sources. Based on dispersion model analysis, the Gear corridor currently has a relatively greater level of road traffic air pollution and associated air pollution health risks.

In addition to monitoring criteria air pollutants, both the BAAQMD and the CARB operate TAC monitoring networks in the SFBAAB. These stations measure 10 to 15 TACs, depending on the specific station. The TACs selected for monitoring are those that have traditionally been found in the highest concentrations in ambient air, and therefore tend to be substantial contributors to community health risk. The BAAQMD operates an ambient TAC monitoring station at its 16th and Arkansas streets facility, which is the only monitoring site for air toxics in the City. Table 4.12-3 shows ambient concentrations of carcinogenic TACs measured at the Arkansas Street station and the estimated cancer risks from lifetime (70 years) exposure to these substances. When TAC measurements at this station are compared to ambient concentrations of various TACs for the Bay Area as a whole, the cancer risks associated with mean TAC concentrations in the City are similar to those for the Bay Area. Therefore, the estimated average lifetime cancer risk resulting from exposure to TAC concentrations measured at the Arkansas Street air monitoring station do not appear to be any greater than for the Bay Area as a region.

Table 4.12-3 Measurement of Carcinogenic Toxic Air Contaminants - Concentrations at Arkansas Street Station and Estimated Cancer Risk from Lifetime Exposure

SUBSTANCE	CONCENTRATION	CANCER RISK PER MILLION/A/
GASEOUS TACS	(PPB)

4.12.2.5 | SENSITIVE RECEPTORS

Some land uses are considered more sensitive to changes in air quality than others, depending on the population groups and the activities involved. CARB has identified the following groups who are most likely to be affected by air pollution: children under 14, the elderly over 65 years of age, athletes, and people with cardiovascular and chronic respiratory diseases. Typically, sensitive receptors include residences, schools, playgrounds, child-care centers, athletic facilities, long-term health care facilities, rehabilitation centers, convalescent centers, and retirement homes. All of sensitive receptors discussed above are located within 1,000 feet of the approximately four miles Geary Corridor.

4.12.3 | Environmental Consequences

This section summarizes effects of the project alternatives regarding on regional and local air quality. The various regulatory requirements described in Section 4.10.1 above require consideration of potential consequences through several means. According, this section is organized as follows:

- Section 4.10.3.1: Transportation Conformity with Federal Clean Air Act
- Section 4.10.3.2: Consistency with Applicable Air Quality Plan
- Section 4.10.3.3: Operational Period Air Pollutant and Greenhouse Gas Emissions
- Section 4.10.3.4: Operational Period Health Risks/Toxic Air Contaminants
- Section 4.10.3.5: Operational Period Odor Effects
- Section 4.10.3.6: Construction Period Air Quality and Greenhouse Gas Emissions
- Section 4.10.3.7: Construction Period Health Risks/Toxic Air Contaminants
- Section 4.10.3.8 Construction Period Odor Effects

4.12.3.1 | TRANSPORTATION CONFORMITY WITH FEDERAL CLEAN AIR ACT

Transportation conformity is required under CAA section 176(c) (42 U.S.C. 7506(c)) to ensure that federally supported highway and transit project activities are consistent with the purpose of the SIP. Conformity to the purpose of the SIP means that transportation activities will not cause new air quality violations, worsen existing violations, or delay timely attainment of the relevant NAAQS. USEPA's transportation conformity rule (40 CFR 51.390 and Part 93) establishes the criteria

and procedures for determining whether transportation activities conform to the SIP. Under the criteria, transportation projects must demonstrate conformity on regional and local levels.

4.12.3.1.1 REGIONAL CONFORMITY

The current RTP is the 2035 Plan for the San Francisco Bay Area. The proposed project is listed in the plan. Both FHWA and the Federal Transit Administration (FTA) made a regional conformity determination for the current RTP in May 2009.

The proposed project is also included in the 2013 TIP. FHWA and FTA approved the 2013 TIP on August 12, 2013.

The design, concept, and scope of the proposed project is consistent with the project descriptions in the RTP and TIP, and also with the "open to traffic" assumptions of the regional emissions analysis MTC conducted in association with its adoption of the RTP. Therefore, the proposed project is considered to have demonstrated regional conformity.

4.12.3.1.2 PROJECT CONFORMITY

Carbon Monoxide Hotspot Analysis

To demonstrate conformity, a project must not cause or contribute to new localized carbon monoxide violations or increase the frequency or severity of existing carbon monoxide violations. According to BAAQMD, air quality monitors have not recorded an air exceedance of the federal carbon monoxide standards since at least 1994. Carbon monoxide concentrations throughout the state have steadily declined over time as vehicle engines have become more efficient and less polluting. The BAAQMD has recognized this trend and completed technical analyses that indicate that there is no potential for a carbon monoxide hotspot to occur when:

- Project traffic would not increase traffic volumes at affected intersections to more than 44,000 vehicles per hour; or
- Project traffic would not increase traffic volumes at affected intersections to more than 24,000 vehicles per hour where vertical and/or horizontal mixing is substantially limited (e.g., tunnel, parking garage, bridge underpass, natural or urban street canyon, below-grade roadway). The fact that the Geary corridor study area is a highly developed urban area with multi-story buildings and contains streets with canyon-like air dispersion characteristics means that this criterion may be applied to certain blocks along the Geary corridor and some of its parallel streets.

None of the alternatives would increase traffic volumes at any intersection in the traffic study area to more than 24,000 vehicles per day. 15 There is no potential for a new localized carbon monoxide violation and further analysis of carbon monoxide concentrations is not required.

¹⁵ The traffic study area includes not only Geary Street/Boulevard but also portions of O'Farrell Street and other streets) to more than 24,000 vehicles per hour

PM_{2.5}/PM₁₀ Hotspot Analyses

Qualitative PM hotspot analysis is required under the USEPA Transportation Conformity rule for Projects of Air Quality Concern (POAQC). Projects that are not POAQC are not required to complete a detailed PM hotspot analysis.

The proposed project is not considered a POAQC because it does not meet the definition of a POAQC as defined in USEPA's Transportation Conformity Guidance. The proposed project would not increase the percentage of diesel vehicles on the roadway, does not involve a bus or rail terminal that significantly increases diesel vehicles, and is not identified in the SIP as a possible PM_{2.5} or PM₁₀ violation site. The proposed project has undergone Interagency Consultation (IAC). IAC participants concurred that the proposed project is not a POAQC.

4.12.3.2 | COMPLIANCE WITH APPLICABLE AIR QUALITY PLAN

The most recently adopted air quality plan for the Air Basin is the 2010 Clean Air Plan (2010 CAP). In determining consistency with the 2010 CAP this analysis considers whether the project would: (1) support the primary goals of the 2010 CAP, (2) include applicable control measures from the 2010 CAP, and (3) disrupt or hinder implementation of control measures identified in the 2010 CAP.

The primary goals of the 2010 CAP are to attain air quality standards, reduce pollutant exposure and protect public health, and reduce greenhouse gas (GHG) emissions. The discussion of project GHG emissions presented demonstrated that the proposed project would comply with the applicable provisions of the City's Greenhouse Gas Reduction Strategy.

The proposed project is a transit project with the goal of making the SFMTA transit system more efficient, thus attracting a greater portion of commuters to use bus instead of private passenger vehicles along the Geary corridor. Implementation of any of the project alternatives, including the No Build Alternative, would result in short-term criteria pollutant emissions during construction.

However, replacement of standard motor coaches with diesel-hybrid electric buses would result in a decrease in several pollutants over the long-term. The analysis herein illustrates that neither construction nor operation of any of the project alternatives would result in emissions of criteria air pollutants that would impede attainment of air quality standards. The construction and operational health risk assessment demonstrates that implementation of any of the project alternatives would not substantially increase risks to public health.

As none of the project alternatives would result in substantial, long-term increases in criteria air pollutants, would not expose receptors to substantial pollutant concentrations, and would not result in substantial, long-term increases in GHG emissions, all of the project alternatives would support the primary goals of the 2010 CAP.

The measures most applicable to the proposed project are transportation control measures (TCMs), which are strategies to reduce vehicle trips, vehicle use, vehicle

¹⁶BAAQMD, Bay Area 2010 Clean Air Plan, September 15, 2010. Available online at: http://www.baaqmd.gov/Divisions/Planning-and-Research/Plans/Clean-Air-Plans.aspx. Accessed February 13, 2014.

miles traveled, vehicle idling, or traffic congestion for the purpose of reducing motor vehicle emissions and Mobile Source Measures, which are strategies involving use of more advanced and less polluting fleet of vehicles. The 2010 CAP includes 17 TCMs to improve transit service, improve system efficiency, encourage sustainable travel behavior, support focused growth, and implement pricing strategies. The TCMs for the 2010 CAP were developed by reviewing the 2005 Ozone Strategy measures and modifying and expanding them based on new investment and policy decisions. In particular, the TCMs have been updated to reflect the policy and investment decisions made in MTC's regional transportation plan, *Transportation 2035: Change in Motion.*¹⁷ Implementation of the project alternatives would be consistent with the following 2010 CAP TCMs:

TCM A-1 Improve Local and Areawide Bus Service - Improve transit by providing new Express Bus or Bus Rapid Transit on major travel corridors, fund replacement of older buses, and implement Transit Priority Measures on key transit routes.

TCM D-3 Support Local Land Use Strategies - Promote land use patterns, policies, and infrastructure investments that support mixed-use, transit-oriented development that reduce motor vehicle dependence and facilitate walking, bicycling and transit use. An evaluation of the 2010 CAP's 55 control measures determined that the Proposed Project would not disrupt or hinder implementation of any of the CAP's 55 control measures.

For the reasons stated above, the proposed project would support, not interfere with implementation of the 2010 CAP. Therefore, the proposed project would be consistent with the most recent air quality plan that shows how the region will improve ambient air quality and achieve state and federal ambient air quality standards.

4.12.3.3 | OPERATIONAL PERIOD CRITERIA AIR POLLUTANT AND GREENHOUSE GAS EMISSIONS

The proposed project would generate operational emissions associated with a shift in regional passenger vehicles miles traveled and new buses servicing Geary Avenue. The operational analysis focused on estimating emissions associated with changes to transit and non-transit vehicle miles traveled (VMT). Passenger vehicle emissions were estimated using VMT and speed data shown in Table 4.12-4. Emission rates were obtained from the CARB EMFAC2011 Motor Vehicle Emissions Inventory Model.

¹⁷Metropolitan Transportation Commission, Change in Motion, Transportation 2035 Plan for the San Francisco Bay Area, Final, April 2009. Available online at: http://www.mtc.ca.gov/planning/2035_plan/. Accessed February 13, 2014.

Regarding transit activity, existing buses were assumed to be a typical standard motor coach manufactured in 1999. Urban buses manufactured between 1999 and 2002 are required to meet the same diesel particulate matter (DPM) and NO_X emission standards. Therefore, it is assumed that all buses are equipped with Cleaire Longview CARE-verified Level 3 emission control technology or equivalent. Existing emissions were estimated using emission rates from EMFAC2011, which includes emission rates in grams per mile and applying 25 percent NO_X and 85 percent DPM reductions to account for the use of the emission control technology.

It is anticipated that the current fleet of 86 diesel hybrid-electric buses (DHEB) will be expanded beginning in 2014. All buses will be DHEB by 2019. DHEBs achieve at least a 25 percent reduction in engine NO_X emissions when compared to a non-hybrid bus of the same year and 2035. Emissions were estimated by using EMFAC2011 emission rates for a 2014 urban bus and applying a 25 percent NO_X reduction to those emissions.

SFMTA has indicated that weekend transit VMT is approximately 75 percent of weekday transit VMT. The SFMTA operates the weekday schedule 253 days per year and operates Saturday and Sunday schedules 54 and 58 days per year, respectively. These factors were used to estimate annual VMT:

$$\Delta VMT_A = 253 \times \Delta VMT_{WD} + 75\% \times (112 \times \Delta VMT_{WD})$$

Where:

 ΔVMT_A : increase in annual transit VMT ΔVMT_{WD} : increase in annual weekly transit VMT

To quantify the effects on regional air quality resulting from a travel mode shift as a result of increased transit efficiency, or implementation of the improvements of the Proposed Project, this analysis used data provided by the SFCTA San Francisco Chained Activity Model Process (SF-CHAMP) model, which provides estimates of the change in weekday non-transit VMT.¹⁸ The change in non-transit VMT has been annualized assuming that Saturday VMT is 85.8 percent and Sunday is 77.7 percent of weekday VMT.¹⁹ Therefore, the conversion of weekday VMT to annual VMT was performed as follows:

$$\Delta VMT_A = 261 \times \Delta VMT_{WD} + 85\% \times (52 \times \Delta VMT_{WD}) + 77.7\% \times (52 \times \Delta VMT_{WD})$$

Where:

 ΔVMT_A : increase in annual non-transit VMT ΔVMT_{WD} : increase in annual non-weekly transit VMT

Table 4.10-5 below summarizes operational period criteria air pollutant and GHG emissions for each of the build alternatives. The VMT and speed estimates were included in the air quality modeling.²⁰ Implementation of any of the build alternatives would generate operational emissions associated with a shift in regional

 ¹⁸SF-CHAMP is a state-of-the-art, activity-based model that predicts future travel patterns for the City.
 ¹⁹ Lockwood, Allison, An Exploratory Analysis of Weekend Activity Patterns in the San Francisco Bay Area, Table 4, November 12, 2004. This document is available for review at the San Francisco Planning Department, 1650 Mission Street, Suite 400 as part of Case file 2011.0558E.

²⁰ CARB EMFAC2011 Motor Vehicle Emissions Inventory Model

passenger VMT and new buses servicing the Geary corridor. The operational analysis focused on estimating emissions associated with changes to transit and non-transit VMT. The SFCTA estimated citywide passenger-vehicle VMT for various scenarios with and without implementation of the build alternatives. Tables 4.10-4 and 4.10-5 below summarize these estimates.

Hybrid Alternative Emissions Increase/(Decrease) Relative to No Build	(0.2)	(0.8)	(0.8)	(0.4)	(5,841)

4.10.3.2.1 NO BUILD ALTERNATIVE

Under the No Build Alternative, transit and transportation facilities and services would remain unaltered except for changes that are currently planned or programmed to be implemented in the Geary corridor by 2020 Most of these improvements would have a negligible effect on operational air pollutant emissions. However, one planned improvement is the replacement of current diesel buses with lower emissions diesel hybrid electric buses. This aspect of the No Build Alternative would represent a beneficial effect relative to existing conditions in terms of both criteria air pollutants and greenhouse gas emissions.

4.12.3.3.2 ALTERNATIVE 2: SIDE-LANE BRT

Alternative 2 and all other build alternatives also include the replacement of current diesel buses with lower emissions diesel hybrid electric models.

By the year 2020, Alternative 2 would result in modest decreases in countywide emissions of PM but no measurable decrease in other criteria pollutants. However, GHG emissions would increase by less than 1 percent relative to existing conditions. The increase is likely due to a combination of factors, including the removal of left turns along the Geary corridor. Notwithstanding, the increase in GHG emissions would be far less than the threshold (25,000 metric TPY of CO₂e) that the CEQ suggests using as an indicator of substantial emissions.

By 2035, both PM and criteria pollutants would drop modestly relative to the No Build Alternative. Moreover, GHG emissions would decrease by 2,015 metric TPY relative to the No Build Alternative. This is a result of increased ridership associated with a mature transit system and various cumulative projects that will feed riders into the system. Therefore, Alternative 2 would result in long-term benefits in reducing both criteria pollutants and GHG emissions.

4.12.3.3.3 ALTERNATIVE 3: CENTER-LANE BRT WITH DUAL MEDIANS AND PASSING LANES

Alternative 3 operational criteria pollutant and GHG emissions are shown in Table 4.10-5. Countywide near-term (2020) regional criteria pollutant emissions would

decrease modestly for all criteria pollutants compared to the 2020 No Build Alternative. GHG emissions would decrease by approximately 1,300 metric TPY of CO2e compared to the No Build Alternative. These reductions in emissions would result in a beneficial effect under Alternative 3 by 2020.

Regarding far-term (2035), emissions for all of the analyzed pollutants would decrease when comparing Alternative 3 to the 2020 No Build Alternative. This is a result of increased ridership associated with a mature transit system and various cumulative projects that will feed riders into the system. Therefore, Alternative 3 would result in a beneficial effect related to operational criteria pollutant and GHG emissions by 2035.

4.12.3.3.4 ALTERNATIVE 3-CONSOLIDATED: CENTER-LANE BRT WITH DUAL MEDIANS AND CONSOLIDATED BUS SERVICE

Alternative 3-Consolidated operational criteria pollutant and GHG emissions are shown in Table 4.10-5. Near-term (2020) countywide regional criteria air pollutant emissions would decrease modestly in 2020 compared to the No Build Alternative. Criteria pollutant emissions reduction would be greater under Alternative 3-Consolidated for reactive organic gases, nitrogen oxides, and PM₁₀ than under any of the other build alternatives. GHG emissions would decrease by approximately 2,500 metric TPY compared to the No Build Alternative. This is the greatest reduction in GHGs for any of the build alternatives. Therefore, Alternative 3-Consolidated would result in the greatest beneficial effect related to operational criteria pollutant and GHG emissions by 2020.

By 2035, both criteria air pollutant and GHG emissions would decrease further compared to the No Build Alternative. Therefore, Alternative 3-Consolidated would result in a beneficial effect related to operational criteria pollutant and GHG emissions by 2035.

4.12.3.3.5 HYBRID ALTERNATIVE

Hybrid Alternative operational emissions are shown in Table 4.10-5. Countywide regional criteria pollutant and GHG emissions would decrease in 2020 and 2035 compared to the No Build Alternative. GHG emissions would decrease by 5,841 metric TPY by 2035, representing the greatest reduction in GHGs compared to the No Build Alternative. Therefore, the Hybrid Alternative would result in a beneficial effect related to operational criteria pollutant and GHG emissions in both the near-and far-term.

4.12.3.4 | OPERATIONAL HEALTH RISK AND TOXIC AIR CONTAMINANTS

An analysis was completed to assess health risk associated with increased bus activity. The roadway segment on Geary Boulevard between Masonic Avenue and Collins Street was identified as the segment with highest project-related increase in bus VMT. Pollutant concentrations were estimated using a similar methodology as described for the regional emissions analysis. Pollutant dispersion was modeled using AERMOD, which considered two source locations: 1) side of the roadway for Alternative 2 and 2) the center lane for Alternative 3, 3C, and the Hybrid Alternative.

The analysis indicated that Alternative 2 would result in a higher risk than the other build alternatives. This is because Alternative 2 would be side-running and the

emissions source (buses) would be located closer to the residences than the center-running BRT. Table 4.13-6 shows the risk associated with Alternative 2. The carcinogenic, chronic, and acute risks, along with the annual average PM_{2.5} concentration would be less than the BAAQMD significance thresholds. Alternatives 3, 3C, and the Hybrid Alternative would result in a lower risk. Therefore, the proposed project would result in a less-than-significant impact related to health risk.

Table 4.12-6 Operational Health Risk Assessment

HEALTH RISK TYPE	UNIT OF MEASUREMENT	THRESHOLD	MAXIMUM HEALTH RISK
EXCESS CANCER RISK	PROBABILITY PER ONE MILLION POPULATION	10	2
CHRONIC HEALTH RISK	HEALTH INDEX	1.0	0.001
ACUTE HEALTH RISK	HEALTH INDEX	1.0	0.004
INCREASE IN PM2.5 CONCENTRATION	AVERAGE ANNUAL (MG/M³)	0.3	0.005

SOURCE: TAHA, 2014.

4.12.3.5 | OPERATIONAL PERIOD ODOR EFFECTS

Land uses and industrial operations that are associated with odor complaints include wastewater treatment plants, landfills, confined animal facilities, composting stations, food manufacturing plants, refineries, and chemical plants. The proposed project would not include any land use or activity that typically generates adverse odors.

4.12.3.6 | CONSTRUCTION PERIOD EMISSIONS

4.12.3.6.1 CONSTRUCTION EMISSIONS: NO BUILD ALTERNATIVE

Under the No Build Alternative, transit and transportation facilities and services would remain unaltered except for changes that are currently planned or programmed to be implemented in the Geary corridor by 2020. These projects have already undergone or will undergo individual environmental review, in which construction emissions would be analyzed. Given the relatively small scale of the improvements comprising the No Build Alternatives, no adverse effects relative to regional construction emissions are expected.

4.12.3.6.2 CONSTRUCTION EMISSIONS: BUILD ALTERNATIVES

Construction activity would generate air emissions from various sources, including equipment engines, truck engines, and earthwork activity. All build alternatives would comply with San Francisco Health Code Article 22B and San Francisco Building Code §106A.3.2.6, which collectively constitute the City's Construction Dust Control Ordinance (adopted in July 2008). They would also comply with Section 6.25 of Chapter 6 of the San Francisco Administrative Code (Clean Construction Ordinance), which requires clean construction practices for all City projects that consist of 20 or more cumulative days of construction. The Clean Construction Ordinance requires that off-road equipment and off-road engines with 25 horsepower or greater: 1) be fueled by biodiesel fuel grade B20 or higher; and 2) if used more than 20 hours, either meet or exceed Tier 2 emissions standard for off-road engines or operate with the most effective verified diesel emission control technology. The requirement does not apply to portable or stationary generators

(engines). Compliance with these regulations would control fugitive dust emissions and substantially reduce exhaust emissions associated with standard construction equipment.

From an air quality perspective (e.g., equipment use), the majority of construction activity would be similar for the various alternatives. However, construction activity associated with bringing Fillmore Street to grade (Alternatives 3 and 3-Consolidated) would generate the maximum emissions as a result of additional truck and equipment activity. Regional construction emissions associated with these scenarios are presented in Table 4.10-7 for Alternatives 3, 3-Consolidated,. Table 4.10-7 also includes emissions for Alternative 2, which represents a typical segment that includes fewer truck trips and less equipment activity than needed to bring Fillmore Street to grade level. Accordingly, Alternative 2 is projected to result in lower daily levels of emissions. As shown in Table 4.10-7, each of the build alternatives is projected to generate daily emissions of criteria pollutants below applicable thresholds. Therefore, none of the alternatives would result in an adverse effect regarding construction period emissions.

Table 4.12-7 Estimated Daily Construction Emissions for all Build Alternatives

	POUNDS PER DAY	•		
CRITERIA POLLUTANT OR OZONE PRECURSOR	ROG	NOX	PM ₁₀	PM _{2.5}

SOURCE: OFFROAD, 2011 and TAHA, 2014.

4.12.3.7 | CONSTRUCTION PERIOD HEALTH RISK AND TOXIC AIR CONTAMINANTS

It is anticipated that highest risk to public health would be associated with bringing Fillmore Street to grade under Alternatives 3, 3-Consolidated, and the Hybrid Alternative. This segment would experience the highest level of construction intensity in terms of equipment use and truck activity. As shown in Table 4.10-7,

construction activity would not generate emissions that would exceed the BAAQMD health risk significance thresholds. Construction activity associated with Alternative 2 or a typical segment for Alternatives 3, 3-Consolidated, and the Hybrid Alternative would result in lower risks. Therefore, implementation of the build alternatives would not result in adverse impacts related to construction health risk.

Table 4.12-8 Construction Health Risk Assessment

HEALTH RISK TYPE	UNIT OF MEASUREMENT	FILLMORE STREET	THRESHOLD
Excess Cancer Risk (per million)	Probability per one million population	0.95	10
Chronic Health Risk	Health Index	0.06	1
Acute Health Risk	Health Index	0.45	1
Increase in PM Concentration	Annual Average (µg/m³)	0.286	0.3

SOURCE: TAHA, 2014.

4.12.3.7.2 DEMOLITION AND RENOVATION OF ASBESTOS-CONTAINING MATERIALS

None of the build alternatives would involve the demolition or renovation of any materials containing asbestos. As described above, the construction associated with each build alternative involves re-paving the corridor, and installing new transportation infrastructure. Therefore, demolition and renovation would not result in any adverse impacts related to asbestos-containing materials for any of the build alternatives.

4.12.3.7.3 NATURALLY OCCURRING ASBESTOS

None of the features of any of the build alternatives are located in an area near NOA, and the grading associated with each of the build alternatives has the potential to expose nearby residents. The implementation of the Basic Construction Mitigation Measures would control NOA exposure to the greatest extent feasible. NOA exposure would not result in any adverse impacts for any of the build alternatives.

4.12.3.8 | CONSTRUCTION RELATED ODORS

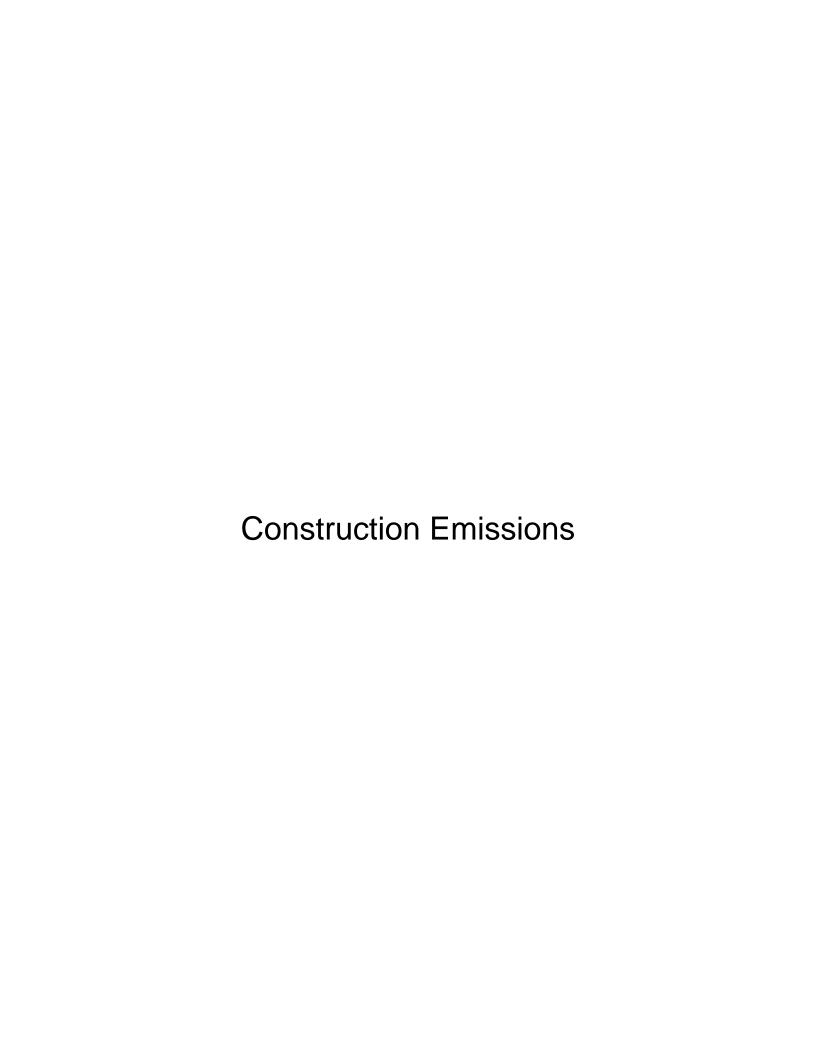

Equipment exhaust and paving activities would result in odor emissions for each of the build alternatives. Odors would be localized and generally confined to the construction area. Each build alternative would utilize typical construction techniques, and the odors would be typical of most construction sites and temporary in nature. Construction activity would not cause an odor nuisance, and construction odors would not result in any adverse impacts for any of the build alternatives.

4.12.4 | Avoidance, Minimization, and/or Mitigation Measures

None of the alternatives would result in any adverse effects, either during operation or construction, related to emissions of air pollutants and greenhouse gases. Therefore, no avoidance, minimization, or mitigation measures are necessary.
